## **PM 3233**

**IMPORTANT**

In correspondence concerning this instrument, please quote the type number and serial number as given on the type plate at the bottom of the instrument.

**WICHTIG**

Bei Schriftwechsel über dieses Gerät wird gebeten, die genaue Typenbezeichnung und die Gerätenummer anzugeben. Diese befinden sich auf dem Leistungsschild an der Unterseite des Geräts.

**IMPORTANT**

Dans votre correspondance et dans vos réclamations se rapportant à cet appareil, veuillez **TOUJOURS** indiquer le numéro de type et le numéro de série qui sont marqués sur la plaquette de caractéristiques fixée sur la plaque de fond de l'appareil.

## 1. General information

### 1.1. Introduction

The 10 MHz Dual-beam Oscilloscope PM 3233 has been designed for general laboratory, service and educational applications.

Both vertical amplifiers are equipped with a drift-reduction circuit and a fully protected field-effect transistor input. All circuits are entirely transistorized and the transistors have been mounted on supports to enable quick servicing.

The instrument features a fully automatic facility which enables triggering on the line and frame sync pulses of a television signal.

The oscilloscope can be supplied from either a.c. mains or external d.c. sources.

The PM 3233 is equipped with a delay unit which provides signal delay to both channels  $Y_A$  and  $Y_B$ .

Fig. 1.1. Dual-beam oscilloscope PM 3233

## 1.2. Characteristics

Properties expressed in numerical values with stated tolerance are guaranteed for nominal mains voltages. Numerical values without tolerances are typical values representing the characteristics of an average instrument.

<i>DESIGNATION</i>	<i>SPECIFICATION</i>	<i>ADDITIONAL INFORMATION</i>
<b>1.2.1. C.R.T.</b>		
Type	PHILIPS E14-100	Split-beam tube, mesh type, post-accelerator, metal-backed phosphor
Measuring area	80 mm x 100 mm	
Screen type	P31 (GH) phosphor	For P7 (GM) phosphor, order PM 3233G (ordering number E14-100GM tube in the parts list
Total acceleration voltage	10 kV	
Overlap of the two systems	100 %	Both in horizontal and vertical direction
Graticule	External, removable	Continuously variable illumination
Engravings	Centimetre divisions with sub-divisions of 2 mm along the central axes. Broken lines indicate 10 % and 90 % of measuring lattice.	Area 80 mm x 100 mm
<b>1.2.2. VERTICAL AMPLIFIERS</b>		
<b>1.2.2.1. Response</b>		
Frequency range	d.c. ... 10 MHz 2 Hz ... 10 MHz	-3 dB bandwidth d.c. coupled -3 dB bandwidth a.c. coupled
Rise time	35 ns	
Overshoot	2 % at maximum	Test pulse of $\geq 10$ ns rise time for 6 cm deflection at 1 MHz
<b>1.2.2.2. Deflection coefficients</b>	2 mV/cm...10 V/cm	Twelve calibrated positions in 1-2-5 sequence. Uncalibrated continuous control 1 : $\geq 2,5$
<b>1.2.2.3. Error limit</b>	$\pm 3$ % $\pm 5$ %	In range +5 °C...+40 °C In range -10 °C ... +55 °C
<b>1.2.2.4. Maximum permissible input voltage</b>	$\pm 400$ V	d.c. + a.c. peak

DESIGNATION	SPECIFICATION	ADDITIONAL INFORMATION
<b>1.2.2.5. Instability of the spot position</b>		
Long-term drift = short-term drift	0,25 cm/hour	Typical value
<b>1.2.2.6. Vertical positioning</b>	16 cm	
<b>1.2.2.7. Dynamic range</b>	24 cm	Peak-to-peak amplitude for sine-wave signals; at 3 MHz negligible distortion
<b>1.2.2.8. Input impedance</b>	1 MOhm/20 pF	
<b>1.2.2.9. Input RC time</b>	0,1 s	Coupling switch to A.C.
<b>1.2.2.10. Visible signal display</b>	$\geq 40$ nsec	Difference between the channels 0,1 division
<b>1.2.3. X-Y MODE</b>	X via $Y_A$	x5 magnifier inoperative
Horizontal frequency range	d.c. ... 1 MHz 2 Hz ... 1 MHz	
Phase shift	$5^\circ$ $1^\circ$	At 100 kHz At 10 kHz
Additional error for $Y_A$ channel	$\pm 2$ % $\pm 3$ %	In range $+5^\circ\text{C}$ ... $+40^\circ\text{C}$ In range $-10^\circ\text{C}$ ... $+55^\circ\text{C}$
<b>1.2.4. TIME BASE</b>		
<b>1.2.4.1. Time coefficients</b>	0,5 s/cm...0,2 $\mu\text{s/cm}$	Twenty calibrated positions in 1-2-5 sequence Uncalibrated continuous control 1 : $\geq 2,5$
<b>1.2.4.2. Coefficient error</b>	$\pm 5$ %	In range $-10^\circ\text{C}$ ... $+55^\circ\text{C}$
<b>1.2.4.3. Expansion</b>		
Magnification	5 x	Switched, calibrated
Additional error	$\pm 2$ % $\pm 3$ %	In range $+5^\circ\text{C}$ ... $+40^\circ\text{C}$ In range $-10^\circ\text{C}$ ... $+55^\circ\text{C}$
<b>1.2.4.4. Time-base output signal</b>		
Output voltage	300 mV	With 50 Ohm termination
Emf (open output voltage)	6 $V_{p-p}$ ( $-2$ V to $+4$ V)	The output terminal may be short-circuited without affecting the time coefficients
Internal resistance	1 kOhm	
<b>1.2.4.5. Positioning range</b>	The beginning and the end of the time-base line can be made visible	

DESIGNATION	SPECIFICATION	ADDITIONAL INFORMATION
<b>1.2.5. TRIGGERING</b>		
1.2.5.1. Source	Internal: channel $Y_A$ , channel $Y_B$ or mains freq. External	
1.2.5.2. Trigger sensitivity	Internal $\leq 1$ cm at 10 MHz External $\leq 1 V_{p-p}$ at 10 MHz	For sine-wave signals
1.2.5.3. Input impedance	100 kOhm//5 pF	
1.2.5.4. Maximum permissible input voltage	$\pm 400$ V	d.c. + a.c. peak
1.2.5.5. Trigger mode	Automatic or normal	
1.2.5.6. Level range	Corresponding to trace height 24 cm 24 V	In the automatic mode In the normal mode External
1.2.5.7. Triggering frequency range	10 Hz ... 10 MHz d.c. ... 10 MHz 20 Hz ... 10 MHz	A.C. coupling D.C. coupling A.C. coupling in the automatic mode
1.2.5.8. Triggering slope	+ or -	
1.2.5.9. Triggering with T.V. signals		Fully automatic; level control switched off.
Mode	Frame Line	Coupled with positions 50 $\mu s/cm$ ... 0,5 s/cm Coupled with positions 0,2 $\mu s/cm$ ... 20 $\mu s/cm$
Trigger sensitivity	1 cm sync pulse	
<b>1.2.6. INTENSITY MODULATION</b>		
Blanking voltage	$\geq +20$ V	A.C. coupled
Input resistance	$\geq 47$ kOhm	
Frequency range	20 Hz ... 1 kHz	
Maximum permissible input voltage	$\pm 400$ V	d.c. + a.c. peak
<b>1.2.7. CALIBRATION GENERATOR</b>		
Type	Square-wave generator	
Output voltage	600 mV <sub>p-p</sub>	
Accuracy	$\pm 1$ %	In range +5 °C ... +40 °C
Frequency	approx. 2 kHz	

<i>DESIGNATION</i>	<i>SPECIFICATION</i>	<i>ADDITIONAL INFORMATION</i>
<b>1.2.8. OPERATING CONDITIONS</b>		
<b>1.2.8.1. Supply</b>	a.c. or d.c.	
Nominal voltage range (on mains voltage adaptor)	a.c. 100 V ... 140 V 198 V ... 265 V d.c. 22 V ... 30 V	
Nominal frequency range	46 Hz ... 400 Hz	
<b>1.2.8.2. Ambient temperature</b>		
Rated range of use	+5 °C ... +40 °C	
Limit range of operation	−10 °C ... +55 °C	
Storage and transport conditions	−40 °C ... +70 °C	
<b>1.2.8.3. Operating position</b>	Any	
<b>1.2.9. WARM-UP TIME</b>	5 minutes	At constant ambient conditions (not including recovery time; see also section 2.1.6.)
<b>1.2.10. POWER CONSUMPTION</b>	40 VA at 220 V a.c. 20 W at 24 V d.c.	0,85 A current drain
<b>1.2.11. MAINS INTERFERENCE</b>	The instrument meets the VDE Storgard K requirement	
<b>1.2.12. MECHANICAL DATA</b>		
Design	Portable	
Dimensions	Depth 503 mm Width 326 mm Height 185 mm	Incl. front cover Incl. handle Incl. feet
Weight	Approx. 9,5 kg	
<b>1.2.13. COOLING</b>	Natural convection	
<b>1.2.14. COMPONENT REPLACEMENTS</b>	Normal production types, transistors plugged in	

## 1.3. Accessories

### 1.3.1. STANDARD ACCESSORIES

1 Front cover with storage  
space for two passive probes  
and two BNC-4 mm adapters  
2 BNC-4 mm adapters PM 9051  
1 Manual

### 1.3.2. OPTIONAL ACCESSORIES

Passive probe sets (10 : 1)	: PM 9326 and PM 9327
Passive probe sets (10 : 1)	: PM 9336 and PM 9336L
Passive probe set (1 : 1)	: PM 9335
2 kV passive probe set (100 : 1)	: PM 9358
Set of miniature probe clips	: PM 9333
Multi-purpose oscilloscope camera	: PM 9380
Adapter (oscilloscope to camera)	: PM 9379

See also chapter 3.5. "Information concerning accessories".

## 2. Directions for use

### 2.1. Installation

#### 2.1.1. REMOVING AND FITTING THE FRONT COVER

- Removing : — Turn the knob in the centre of the cover a quarter of a turn anti-clockwise  
 — Take the cover off
- Fitting : — Align the key of the locking knob with the slot in the text plate of the instrument  
 — Fit the cover over the front of the oscilloscope  
 — Press the knob and turn it a quarter of a turn clockwise

#### WARNING

This instrument generates high voltages and should not be operated with the covers removed. The mains plug or external voltage source should be removed before attempting any maintenance work, and any relevant high voltage points discharged.

#### 2.1.2. ADJUSTING TO THE LOCAL MAINS SUPPLY AND FUSES

Before switching-on, the instrument must be adjusted to the local mains voltage by means of the voltage adapter at the rear.

It is possible to adjust the instrument to 110 V, 127 V, 220 V and 240 V by means of a screwdriver.

The selected voltage is visible through the opening at the rear.

The instrument can optionally (Spec. V) be adapted for 100 V, 127 V, 200 V and 220 V.

The temperature-sensitive fuse is mounted between the mains transformer windings. It can be replaced after having removed the rear cover (3 screws "X", Fig. 2.1.).

Terminals "N" and "1" (see transformer at figures 3.20 and 3.43.) must be unsoldered; in order to remove the fuse, bend the enclosure slightly to the outside so that the locking pin can be disengaged.

A new fuse is removed from its housing in the same way as described before. It is then pushed in the same enclosure as the old one until the locking pin snaps into the hole, the loop pointing to the "N" terminal. After having terminals "N" and "1" soldered, the instrument can be considered as ready for use.

Fig. 2.1. Rear view showing sockets

## 2.2. Operating instructions

Before switching on, ensure that the oscilloscope has been correctly installed in accordance with chapter 2.1. Installation, and that the precautions outlined have been observed.

### 2.2.1. CONTROLS AND SOCKETS (Fig. 2.2.)

X POSITION (R1)	Continuously variable control giving horizontal positioning of the display.
MAGN' (SK1)	Incorporates a switch for calibrated 5x magnification of the time base.
TIME/cm (SK2)	Time-coefficient control of the time-base; 21-way switch with a position for external X deflection (X via $Y_A$ ).
CAL. - TIME/cm (R2/SK3)	Continuously variable control of the time coefficients. In the CAL. position the time-coefficient is calibrated.
LEVEL (R3)	Continuously variable control to select the level at which the time-base generator starts.
CAL. (BU1)	Outlet for square-wave voltage of 600 mV <sub>p-p</sub> for calibration purposes.
TRIGGERING (SK4....13)	Controls for trigger source, slope and mode; 10-way push-button switch.
$Y_A$ (SK4)	Internal triggering signal derived from channel $Y_A$ .
$Y_B$ (SK5)	Internal triggering signal derived from channel $Y_B$ .
EXT. (SK6)	Triggering signal derived from a voltage applied to the TRIGG. input socket.
MAINS (SK7)	Triggering signal derived from an internal voltage with mains frequency. This trigger source is inoperative when the instrument is supplied with an external d.c. voltage.
+	(SK8) Provides for triggering on the positive slope of the signal.
-	(SK9) Provides for triggering on the negative slope of the signal.
AUTO (SK10)	Provides for a free-running time-base in the absence of triggering signals and automatic signal-derived limitation on the LEVEL control range.
AC (SK11)	Triggering with coupling capacitor in triggering-signal path.
DC (SK12)	Direct coupling for triggering on a slowly varying voltage or for full-bandwidth working.
TV (SK13)	Enables triggering on either line or frame pulses of TV signals, as dictated by the position of TIME/cm switch SK2. Triggering on frame pulses in positions 50 $\mu$ s/cm to 0,5 s/cm and on line pulses in positions 0,2 $\mu$ s/cm to 20 $\mu$ s/cm.
TRIGG. (BU2)	Input BNC socket for external triggering signals.
BEAM SELECTOR A (SK 14)	If this push-button is depressed, vertical deflection is achieved by the signal connected to the channel $Y_A$ input.
BEAM SELECTOR B (SK 15)	If this push-button is depressed, vertical deflection is achieved by the signal connected to the channel $Y_B$ input.
	If both switch A (SK 14) and switch B (SK 15) are depressed, vertical deflection is achieved by both the signal connected to the channel $Y_A$ input and the signal connected to the channel $Y_B$ input.
AC-0-DC (SK 16 & 19)	Signal coupling, three position switch. AC : via coupling capacitor O : interruption of connection between input socket and input circuit, the latter being earthed. DC : Direct coupling.

AMPL. (SK 17 & 18)	Control of the vertical deflection coefficients, 12-way switch.
CAL. - AMPL. (R4 & 5)	Continuously variable control of the vertical deflection coefficients. In the CAL. position, the deflection coefficient is calibrated.
DC BAL. (R6 & 7)	Continuously variable control of the direct-voltage balance of the vertical amplifier.
ILLUM. (SK 20 & R8)	Continuously variable control of the graticule illumination. Incorporates mains switch.
FOCUS (R9)	Continuously variable control of the electron-beam focusing.
INTENS. (R10)	Continuously variable control of the trace brilliance.
1 MOhm - 20 pF (BU3 & 5)	Input BNC socket for the vertical deflection signals.
POSITION (R11 & 12)	Continuously variable control giving vertical positioning of the display.
 (BU4)	Earth socket.

At the rear of the instrument (Fig. 2.1.):

TB OUT (BU6)	Sawtooth output BNC socket.
Z MOD. (BU7)	Input BNC socket for intensity-modulation voltages.
EXT. DC SUPPLY (BU8)	Input socket for d.c. supply.

## 2.2.2. PRELIMINARY SETTINGS

We recommend to allow a warm-up time of five minutes before you start your measurements. This warm-up time does not include a recovery time when the instrument comes in from the cold (see also section 2.1.6.).

- In case of mains operation:  
Check that the mains voltage adapter indicates the local mains voltage. If necessary, set the adapter to the relevant voltage in accordance with 2.1.2.  
Switch on the instrument.
  - In case of external d.c. supply:  
Check that the external source is properly connected, with the positive terminal to earth.
  - Set FOCUS control R9 and INTENS. control R10 to their mid-positions.
  - Depress BEAM SELECTOR buttons A SK 14 and B SK 15. Bear in mind that there will be no display if no BEAM SELECTOR button is depressed.
  - Select trigger source, slope and mode. If no TRIGG. button has been depressed, the oscilloscope triggers on the  $Y_A$  signal, on the positive slope and in an AUTO mode without level range limitation.
  - Display the two traces by means of Y POSITION controls R11 and R12.
- The oscilloscope is then ready for use. For correction of the d.c. balance, refer to section 3.2.4.2.

## 2.2.3. INPUTS $Y_A$ AND $Y_B$ AND THEIR POSSIBILITIES

The PM 3233 has been provided with two identical vertical channels which can be used for either YT measurements in combination with the time-base generator, or XY measurements up to frequencies of 1 MHz.

### 2.2.3.1. YT Measurements

To display one signal, either of the two vertical channels can be selected by operating either BEAM SELECTOR A SK 14 or BEAM SELECTOR B SK 15. When both push-buttons A SK 14 and B SK 15 are depressed, two signals can be displayed simultaneously. The Y deflection coefficient can be individually set for each channel.

### 2.2.3.2. XY Measurements

If TIME/cm switch SK2 is set to position X via  $Y_A$ , the time base generator is switched off. The signal of the  $Y_A$  channel is displayed horizontally. The  $Y_A$  controls, except the POSITION potentiometer R11, then control the X deflection. Positioning of the trace in horizontal sense is still possible with X POSITION control R1. The x5 MAGNIFIER switch SK 1, however, is inoperative. In this mode, XY measurements can be up to a frequency of 100 kHz.

### 2.2.3.3. Influence of the AC-0-DC switch

Signals to be studied can be fed to  $Y_A$  input socket BU3 and/or  $Y_B$  input socket BU5. Depending on the composition of the signal, the AC-0-DC switch should be set to position AC or DC. In position DC, the input is coupled direct to the Y amplifier. Because the Y amplifier is d.c. coupled, the entire bandwidth of the instrument is available. This means that the complete input voltages are fed to the deflection plates, which implies that the d.c. components result in trace shifts on the screen.

This may cause difficulties when a.c. signals superimposed on high direct voltages have to be displayed.

In order to make the a.c. signal visible in those cases, a greater attenuation will be necessary with the result that the a.c. signal will also be strongly attenuated.

In this case the AC-0-DC switch can be set to position AC. Then a blocking capacitor is connected between the input socket and the Y amplifier. As a result of this, d.c. voltages are blocked, but also the lower frequencies are suppressed or attenuated. When square-wave signals of low frequency are displayed, this will result in some pulse droop.

In the 0 position of the AC-0-DC switch it is possible to quickly determine the zero volt d.c. level.

In this position the connection between the amplifier input and the input socket is interrupted, the amplifier input being earthed. At the same time, the blocking capacitor is discharged to prevent damage of the circuit under test by a possible high charge.

## 2.2.4. TRIGGERING

### 2.2.4.1. General

In order to obtain a stationary trace, the horizontal deflection must always be started at a fixed point of the signal. The time-base generator is, therefore started by narrow trigger pulses formed in the trigger pulse shaper (Schmitt trigger), controlled by a signal originating from the vertical input signal or an external source.

### 2.2.4.2. Trigger coupling

- AC      If the signal voltage contains a d.c. component triggering can cease when the level potentiometer cannot supply the correct d.c. level for the Schmitt trigger. In this case it is useful to apply a.c. coupling. A.C. Coupling is obtained by inserting a capacitor in the trigger path. This means that the signal can still be d.c. coupled to the Y channels.
- DC      D.C. Coupling is useful when the mean value of the signal varies. This sort of signal often occurs in digital systems. With a.c. coupling the trigger point would not be fixed which would give rise to jitter or even loss of triggering.

### 2.2.4.3. Trigger level

In case of a complicated signal in which a number of non-identical voltage shapes occur periodically, the time axis should always be started with the same voltage shape so as to obtain a stationary trace.

This is possible when one of the details has a deviating amplitude. By means of the LEVEL knob, the trigger level can be set in such a way that only this larger voltage variation passes this level. The LEVEL control is also very useful when two signals must be accurately compared e.g. in phase measurements. By means of the LEVEL control the starting point of the traces can then be shifted exactly on to the central graticule line.

### 2.2.4.4. Automatic triggering

Automatic triggering, when the AUTO switch is depressed, is most often used on account of its simple operation.

In this mode it is possible to display a large variety of waveforms having different amplitude and shape, without it being necessary to operate any of the trigger controls.

If no triggering signal is present, a time-base line remains visible on the screen. This is useful for zero reference purposes. In this trigger mode the level can be adjusted over the peak-to-peak value of the a.c. component of the signal. If none of the switches AUTO, AC, DC or TV is depressed, the oscilloscope works in the automatic mode, but with the entire level range available. This has the advantage that there is always a trace visible, even when no TRIGG. push-buttons are depressed.

### 2.2.4.5. External triggering

External triggering is applied for signals having a strongly varying amplitude, if a signal having a fixed amplitude and equal frequency is available. Even more important is external triggering in case of complex signals and pulse patterns. Then external triggering can be used to avoid double traces.

This obviates the necessity of readjusting the level setting at every variation of the input signal.

### 2.2.4.6. Triggering with the mains frequency

In this case the triggering signal is a sine-wave with the mains frequency. This trigger source is useful if the frequency of the signal under observation is coupled with the mains frequency.

It is, e.g., possible to recognize the hum component of a signal by triggering on that component.

### 2.2.4.7. Triggering with television signals

It is possible to trigger on the line or frame sync pulses of television signals. In positions .5 s to 50  $\mu$ s of the TIME/cm switch triggering takes place on the frame sync pulses and in positions 20  $\mu$ s to .2  $\mu$ s on the line sync pulses of the signal.

The position of the trigger slope switches must correspond to the polarity of the video information of the signal.

## 2.3. Description of the block diagram

### 2.3.1. Y AXIS

The oscilloscope PM 3233 has two identical, d.c. coupled vertical amplifiers allowing simultaneous display of two signals. Each amplifier comprises an input step-attenuator, a source follower with protection circuitry, a pre-amplifier and a drift reduction circuit, a trigger pick-off stage, a delay line circuit and a final amplifier. Trigger pick-off stage and final amplifier (for both channels,  $Y_A$  and  $Y_B$ ) have been coupled by means of the delay line circuit, which is a part of the circuitry of the delay line unit. The protection circuitry prevents damage to the input field-effect transistors by too high sensitivity of the amplifier.

The trigger pick-off stage supplies a triggering signal to the trigger pre-amplifier in case of internal triggering, and also couples the signal to the Y final amplifier. In the  $Y_A$  channel the signal can also be coupled to the X final amplifier if the instrument is used as an XY oscilloscope. From the Y final amplifier, the signal is fed to the Y deflection plates of the c.r.t.

The delay line has been applied to enable the display of the leading edge of fast phenomena on the screen.

### 2.3.2. TRIGGERING

A triggering signal can be obtained from either vertical amplifier, from an external source or internally from the mains. The latter signal is not available when the instrument is supplied with an external d.c. voltage. The triggering signal is fed to a trigger pulse shaper which supplies well-defined trigger pulses to start the time-base generator. The trigger unit also comprises a sync separator for television signals so that triggering by means of these signals is also possible.

### 2.3.3. TIME BASE

The time-base generator is of the constant-current integrator type and supplies two output voltages. A sawtooth voltage which is fed to the X final amplifier and an output socket at the rear of the oscilloscope and a gate pulse which controls the unblanking of the c.r.t. during the sweep.

### 2.3.4. X AXIS

The X final amplifier receives its input signal from either the time-base generator or from an external source via the  $Y_A$  channel. From the X amplifier the signal is fed to the horizontal deflection plates of the c.r.t. of the oscilloscope.

### 2.3.5. CATHODE-RAY TUBE CIRCUIT

The cathode-ray tube is of the split-beam type with one control for the brilliance of the trace and one for focusing. The cathode of the c.r.t. is a.c. coupled to a socket for external Z modulation. The high voltages for the c.r.t. are generated by a converter which also delivers the other supply voltages.

## 2.4. Brief checking procedure

### 2.4.1. STARTING POSITIONS OF THE CONTROLS

- Push-buttons  $Y_A$  SK4, + SK8 and BEAM SELECTOR A SK14 & B SK 15 depressed.
- TIME/cm switch SK2 to .1 ms
- AMPL switches SK 17 & SK 18 to .1 V/cm
- MAGN switch SK 1 to x1
- POSITION potentiometers R1, R11 and R12 to their mid-positions
- INTENS potentiometer R10 fully clockwise
- TIME/cm and AMPL potentiometers R2, R4 and R5 to CAL

Unless otherwise stated, the controls always occupy the same position as in the previous check.

### 2.4.2. C.R.T. POSITION

- Adjust FOCUS potentiometer R9 and INTENS potentiometer R10 for a well-defined display
- Centre both time-base lines, using POSITION potentiometers R1, R11 and R12
- Check that the time-base line runs exactly in parallel with the horizontal graticule lines.  
Correction possible with potentiometer R813 (Fig. 3.11.).

### 2.4.3. VERTICAL CHANNELS

The check for channel  $Y_A$  is described, the relevant controls for  $Y_B$  are mentioned in brackets.

- Release BEAM SELECTOR B SK15 (A SK14)
- AC-0-DC switches SK16 & SK19 to 0
- AMPL switch SK17 (SK18) to 2 mV/cm
- Check that the time-base line remains within 4 mm in the centre of the screen. Correction possible with DC BAL potentiometer R6 (R7)
- AC-0-DC switch SK16 (SK19) to DC
- Check that the time-base line has not moved more than 4 mm. Correction possible with potentiometer R126 (R326), Fig. 3.13.
- AMPL switch SK17 (SK18) to .1 V/cm
- Apply a square-wave voltage of  $600 \text{ mV}_{p-p} \pm 0,5 \%$ , 2 kHz, to  $Y_A$  ( $Y_B$ ) input socket BU3 (BU5)
- Check that the trace height is  $6 \text{ cm} \pm 2 \%$   
Correction possible with R111 (R311), Fig. 3.13.
- Increase the frequency of the input voltage to 10 MHz.
- Check that the trace height is at least 4,2 cm.

### 2.4.4. X VIA $Y_A$

- Depress BEAM SELECTOR A SK 14 and B SK 15
- Set TIME/cm switch SK 2 to X via  $Y_A$
- AC-0-DC switch SK 19 to 0
- Apply a square-wave voltage of  $600 \text{ mV}_{p-p} \pm 0,5 \%$ , 2 kHz, to  $Y_A$  input socket BU3
- Check that the trace width is  $6 \text{ cm} \pm 3 \%$   
Correction possible with potentiometer R601 (Fig. 3.12.)

**2.4.5. TIME-BASE**

- Check the time-coefficient in position 20  $\mu$ s of TIME/cm switch SK2 by means of time markers. Tolerance  $\pm 5$  %. Correction possible with potentiometer R534 (Fig. 3.12.).
- Check the other time-coefficients; tolerance  $\pm 5$  %.

**2.4.6. TRIGGERING**

- Apply a sine-wave voltage of 100 mV<sub>p-p</sub>, 10 MHz, to Y<sub>A</sub> input BU3
- Check that it is possible to adjust LEVEL potentiometer R3 for a stationary display.

# 1. Allgemeine Informationen

## 1.1. Einleitung

Der 10-MHz-Zweistrahl-Oszillograf PM 3233 ist für allgemeine Laborarbeiten, den Service und für Unterrichtszwecke vorgesehen.

Beide Y-Verstärker besitzen eine driftarme und voll überlastungsgeschützte Eingangsschaltung mit Feldeffekttransistoren. Alle Schaltungen sind voll transistorisiert. Die Transistoren stecken in Fassungen, damit sie nötigenfalls schnell ersetzt werden können.

Das Gerät besitzt eine vollautomatische Triggerschaltung für Zeilen- und Bildsynchronimpulse eines Fernsehsignals.

Der Oszillograf kann mit Netzspannung oder einer externen Gleichspannung betrieben werden.

Der Oszillograf PM 3233 ist mit einer Signalverzögerungseinheit ausgerüstet, die für beide Kanäle  $Y_A$  und  $Y_B$  das Signal verzögert.

Abb. 1.1. Zweistrahl-Oszillograf PM 3233

## 1.2. Technische Daten

Zahlenwerte mit Toleranzangabe werden bei den nominalen Netzspannungen garantiert. Zahlenwerte ohne Toleranzangabe sind Durchschnittswerte und dienen nur zur Information.

## 2. Gebrauchsanleitung

### 2.1. Inbetriebnahme

#### 2.1.1. ABNEHMEN UND AUFSETZEN DES DECKELS

- Abnehmen : — Den Knopf in der Mitte des Deckels eine viertel Umdrehung nach links drehen.  
 — Den Deckel abnehmen.
- Aufsetzen : — Den Verriegelungsstift so ausrichten, dass er in den Schlitz in der Textplatte des Instruments passt.  
 — Den Deckel an der Vorderseite des Oszillografen befestigen.  
 — Den Knopf hineindrücken und eine viertel Umdrehung nach rechts drehen.

#### WARNUNG

In diesem Gerät werden hohe Spannungen erzeugt. Deshalb sollte es niemals in geöffnetem Zustand eingeschaltet werden. Vor Wartungsarbeiten ist der Netzstecker zu ziehen oder die externe Spannungsquelle abzuklemmen und ist dafür zu sorgen, dass alle Hochspannung führende Teile entladen sind.

#### 2.1.2. NETZSPANNUNGSEINSTELLUNG UND SICHERUNGEN

Vor dem Einschalten ist das Gerät mit dem Spannungsumschalter an der Rückseite an die örtliche Netzspannung anzupassen.

Das Gerät kann mit einem Schraubenzieher auf 110 V, 127 V, 220 V und 240 V eingestellt werden.

Die gewählte Spannung ist durch eine Öffnung an der Rückseite des Geräts sichtbar.

Auf Wunsch (Spez. V) kann das Gerät auch für 100 V, 127 V, 200 V und 220 V geliefert werden.

Die temperaturempfindliche Sicherung befindet sich zwischen den Wicklungen des Netztransformators.

Sie kann nach Abnehmen der Rückwand ersetzt werden (drei Schrauben X, Abb. 2.1.).

Die Anschlüsse "N" und "1" (siehe Abb. 3.20 und 3.43) werden abgelötet. Zum Entfernen der Sicherung ist der Sperrnocken am Sicherungskörper freizulegen, indem man den Mantel etwas auswärtsbiegt.

Auf ähnliche Weise wird die neue Sicherung aus dem Gehäuse entfernt und, während die Schleife dem Anschluss "N" zugewandt ist, eingesetzt. Die Sicherung hineinschieben, bis der Nocken in die Sperröffnung einrastet. Nach Festlöten der Anschlüsse "N" und "1" ist das Gerät betriebsfertig.

Abb. 2.1. Rückansicht mit Buchsen

### 2.1.3. ANSCHLUSS AN EINE EXTERNE GLEICHSPANNUNGSQUELLE

Das Gerät kann an eine externe Gleichspannung von 22 bis 30 V angeschlossen werden; die Stromaufnahme beträgt 0,85 A. Diese Spannung ist an Buchse BU8 EXT. D.C. SUPPLY anzuschliessen. DER PLUSPOL DER SPANNUNG IST MIT ERDE ZU VERBINDEN' WIE ES IN DEM SCHALTBILD AN DER HINTEREN TEXTPLATTE ZU SEHEN IST, DA DER PLUSPOL DER STROMVERSORGUNG MIT DEM CHASSIS VERBUNDEN IST.

Bei einer falschen Polung der Spannungsquelle wird der Oszillograf nicht beschädigt. Beim Betrieb an einer externen Gleichspannung wird das Gerät von Sicherung VL802 (Abb. 2.3.) geschützt, die sich auf der Stromversorgungsleiterplatte befindet und nach Abnahme der Rückwand zugänglich ist. VL802 hat einen Wert von 1,25 A, träge.

Abb. 2.3. Rückansicht mit Sicherung VL802

### 2.1.4. ERDUNG

Aus Sicherheitsgründen muss der Oszillograf über den Erdschluss an der Rückseite (gekennzeichnet mit ) oder über das Netzkabel, wenn das Gerät an eine Schukosteckdose angeschlossen wird, geerdet werden. Es ist auch darauf zu achten, dass die Erdverbindung des Oszillografen nicht durch ein Verlängerungskabel oder irgendeine andere Vorrichtung unterbrochen wird, die keinen Erdleiter besitzt.

### 2.1.5. EINSCHALTEN

Bei Netzbetrieb wird das Gerät mit dem Schalter eingeschaltet, der mit der Rasterbeleuchtung gekoppelt ist. Das Netzkabel befindet sich in einem Fach unter dem Gerät. Beim Anschluss an eine externe Gleichspannung ist der Netzschalter ausser Betrieb. Das Gerät ist eingeschaltet, sobald die externe Gleichspannung angeschlossen ist. In beiden Fällen wird der Betriebszustand von der weissen Signallampe angezeigt.

Das Gerät darf in jeder Betriebslage verwendet werden, aber es ist darauf zu achten, dass die freie Luftzirkulation nicht behindert wird. Für die zulässigen Umgebungstemperaturen siehe Abschnitt 1.2.8.2.

### 2.1.6. INBETRIEBNAHME EINES UNTERKÜHLTEN GERÄTES

In Abschnitt 1.2. "Technische Daten" steht, dass das Gerät nach einer Anwärmzeit von 5 Minuten und in einen Temperaturbereich von +5 °C bis +40 °C die garantierten Daten einhält.

Es gibt hierbei aber eine Ausnahme. Wenn man zum Beispiel den Oszillografen nachts bei Temperaturen unter 0° im Auto lassen und dann am folgenden Morgen in einen Raum mit einer Temperatur von 25 °C bringt, tritt an den einzelnen Bauelementen Kondensation auf.

Die hochohmigen Widerstände des Oszillografen verlieren durch die Leckströme über die Kondensation ihre Eigenschaften, wodurch der Oszillograf nicht mehr einwandfrei arbeitet. In diesem Fall ist etwa 2 Stunden zu warten, bis der Oszillograf akklimatisiert und alle Kondensationsflüssigkeit verdampft ist.

## 2.2. Bedienungsanleitungen

Vor dem Einschalten ist zu kontrollieren, ob der Oszillograf Abschnitt 2.1. "Inbetriebnahme" entsprechend angeschlossen ist und die dort beschriebenen Vorsorgemassnahmen beachtet wurden.

### 2.2.1. BEDIENTUNGSORGANE UND BUCHSEN (Abb. 2.2. Seite 17)

X POSITION (R1)	Stufenlos veränderliche Einstellung der horizontalen Lage des Elektronenstrahls.
MAGN. (SK1)	Mit Schalter für kalibrierte fünffache Dehnung der Seitablenkung.
TIME/cm /SK2)	Einstellung des Zeitmasstabes; 21 stufiger Schalter mit einer Stellung für externe X-Ablenkung (X über $Y_A$ ).
CAL.-TIME/cm (R2/SK3)	Stufenlos veränderliche Einstellung der Zeitmasstäbe. In Stellung CAL ist der Zeitmasstab kalibriert.
LEVEL (R3)	Stufenlos veränderliche Einstellung des Pegels, bei dem der Zeitablenkgenerator startet.
CAL. (BU1)	Buchse mit Rechteckspannung von 600 mV <sub>ss</sub> für Kalibrierzwecke.
TRIGGERUNG (SK4 ... 13)	10fache-Drucktaste für die Einstellung von und Triggerart.
$Y_A$ (SK4)	Triggersignal intern von Kanal $Y_A$ abgenommen.
$Y_B$ (SK5)	Triggersignal intern von Kanal $Y_B$ abgenommen.
EXT. (SK6)	Triggersignal von der Triggereingangsbuchse abgenommen.
MAINS (SK7)	Triggersignal von einer internen Spannung mit Netzfrequenz abgenommen. Diese Triggerquelle ist bei Betrieb mit einer externen Gleichspannung nicht vorhanden.
+ (SK8)	Triggerung auf der positivgerichteten Flanke des Signals.
- (SK9)	Triggerung auf der negativgerichteten Flanke des Signals.
AUTO (SK10)	Freilaufende Zeitablenkung beim Fehlen von Triggersignalen und automatische vom zugeführten Signal abgeleitete Begrenzung des Pegeleinstellbereiches.
AC (SK11)	Triggersignal wird über Trennkondensator zugeführt.
DC (SK12)	Direkte Kopplung des Triggersignals bei einer sich langsam ändernden Spannung, oder wenn die volle Bandbreite erforderlich ist.
TV (SK13)	Triggerung auf Zeilen- oder Bildimpulsen eines Fernsehsignals, je nach Stellung von Schalter SK2 TIME/cm. Triggerung auf Bildimpulsen in den Stellungen 50 $\mu$ s/cm bis 0,5 s/cm und auf Zeilenimpulsen in den Stellungen 0,2 $\mu$ s/cm bis 20 $\mu$ s/cm.
TRIGG. (BU2)	BNC-Buchse für externe Triggersignale.
BEAM SELECTOR A (SK14)	Wenn diese Taste gedrückt ist, wird das Signal von Kanal $Y_A$ vertikal dargestellt.
BEAM SELECTOR B (SK15)	Wenn diese Taste gedrückt ist, wird das Signal von Kanal $Y_B$ vertikal dargestellt. Wenn Schalter A (SK14) und Schalter B (SK15) gedrückt sind, werden sowohl das Signal von Kanal $Y_A$ als auch das von Kanal $Y_B$ vertikal dargestellt.

AC-0-DC (SK16 & 19)

Dreistellungsschalter für die Signalenkopplung.

AC : über einen Trennkondensator

0 : Eingangsbuchse ist nicht mit der Schaltung verbunden, die Schaltung ist geerdet

DC : Gleichspannungskopplung

AMPL. (SK17 & 18)

Einstellung der vertikalen Ablenkoeffizienten, 12stufiger Schalter.

CAL. – AMPL. (R4 & 5)

Stufenlos veränderliche Einstellung der vertikalen Ablenkoeffizienten. In Stellung CAL. sind die Ablenkoeffizienten kalibriert.

DC BAL. (R6 & R7)

Einstellung der Gleichspannungssymmetrie der Y-Verstärker.

(Schraubenziehereinstellung)

ILLUM. (SK20 & R8)

Stufenlos einstellbare Rasterbeleuchtung.

Ausserdem Netzschalter.

FOCUS (R9)

Fokussierung des Elektronenstrahls.

INTENS. (R10)

Helligkeitseinstellung des Elektronenstrahls.

1 MOhm – 20 pF (BU3 & 5)

BNC-Eingangsbuchsen für die Y-Verstärker.

POSITION (R11 & 12)

Stufenlose Einstellung der vertikalen Lage des Elektronenstrahls.

 (BU4)

Erdungsbuchse

An der Rückseite des Gerätes (Abb. 2.1.):

TB OUT (BU6)

Sägezahnausgang, BNC-Buchse

Z MOD. (BU7)

Eingang für Helligkeitssteuerung, BNC-Buchse.

EXT. DC SUPPLY (BU9)

Eingangsbuchse für externe Gleichspannung.

## 2.2.2. GRUNDEINSTELLUNGEN

Wir empfehlen, das Gerät 5 Minuten vor den Messungen einzuschalten. Diese Vorwärmzeit genügt allerdings nicht, wenn das Gerät aus einem kalten Raum kommt und erst akklimatisiert werden muss (siehe auch Abschnitt 2.1.6.).

– Bei Netzbetrieb:

Prüfen, ob der Netzspannungsumschalter auf die vorhandene Netzspannung eingestellt ist. Falls erforderlich, den Umschalter richtig einstellen, wie es in Abschnitt 2.1.2. angegeben ist.

Das Gerät einschalten.

– Bei externer Gleichspannung:

Prüfen, ob die externe Spannungsquelle richtig angeschlossen ist, Pluspol an Erde.

– Die Potentiometer FOCUS und INTENS (R9 und R10) in Mittelstellung drehen.

– Die Tasten BEAM SELECTOR A SK14 und SK15 drücken. Wenn keine dieser Tasten gedrückt wird, erscheint auf dem Schirm kein Bild.

– Triggerquelle, Triggerfalte und Triggerart wählen. Wenn keine dieser Tasten gedrückt ist, triggert der Oszillograf das  $Y_A$ -Signal an der positiven Flanke und automatisch ohne Pegelbegrenzung.

– Die beiden Elektronenstrahlen mit den Knöpfen Y POSITION (R11 und R12) auf dem Schirm abbilden.

Der Oszillograf ist nun betriebsbereit. Für eine Korrektur der Gleichspannungssymmetrie siehe 3.2.4.2.

## 2.2.3. EINGÄNGE $Y_A$ UND $Y_B$ UND IHRE MÖGLICHKEITEN

Der Oszillograf PM 3233 besitzt zwei identische Vertikalkanäle, die entweder zusammen mit dem Zeitablenkgenerator für Y-T-Messungen oder aber für X-Y-Messungen bis 1 MHz verwendet werden können.

### 2.2.3.1. Y-T-Messungen

Zur Darstellung eines Signals ist einer der beiden vertikalen Kanäle mit BEAM SELECTOR A SK14 oder BEAM SELECTOR B SK15 zu wählen. Wenn beide Tasten A SK14 und B SK15 gedrückt werden, können zwei Signale gleichzeitig abgebildet werden. Der Ablenkkoeffizient lässt sich für jeden Kanal getrennt einstellen.

### 2.2.3.2. X-Y-Messungen

Wenn Schalter SK2 TIME/cm in Stellung X via  $Y_A$  steht, ist der Zeitablenkgenerator ausgeschaltet. Das Signal des  $Y_A$ -Kanals wird nun horizontal abgebildet. Mit den Bedienungselementen für  $Y_A$ , ausgenommen Potentiometer R11 POSITION, wird nun die X-Ablenkung eingestellt. Nur für die Verschiebung des Elektronenstrahls in horizontaler Richtung muss Potentiometer R1 X POSITION verwendet werden. Die fünffache Dehnung mit Schalter SK5 ist jedoch ausser Betrieb.

Bei dieser Einstellung sind X-Y-Messungen bis zu 100 kHz möglich.

### 2.2.3.3. Funktion des Schalters AC-0-DC

Die zu untersuchenden Signale sind an den  $Y_A$ -Eingang BU3 bzw. den  $Y_B$ -Eingang BU4 anzuschliessen. Je nach Zusammensetzung des Signal ist der Schalter AC-0-DC in Stellung AC oder DC zu setzen. In Stellung DC ist der Eingang direkt mit dem Y-Verstärker verbunden. Da der Y-Verstärker gleichspannungsgekoppelt ist, steht die ganze Bandbreite des Gerätes zur Verfügung. Das bedeutet, dass das vollständige Eingangssignal an die Ablenkplatten gelangt, einschliesslich einer evt. Gleichspannungskomponente, die den Strahl auf dem Schirm verschiebt.

Falls kleinere Wechselspannungen hohen Gleichspannungen überlagert sind, kann dies zu Schwierigkeiten führen. Um in solchen Fällen die Wechselspannung sichtbar machen zu können, muss das Eingangssignal stark abgeschwächt werden, wodurch der Wechselspannungsanteil nur sehr klein wiedergegeben wird.

In diesem Fall ist der Schalter AC-0-DC auf AC zu stellen.

Nun liegt ein Trennkondensator zwischen der Eingangsbuschse und dem Y-Verstärker, der Gleichspannungen zurückhält, aber ausserdem die sehr tiefen Frequenzen unterdrückt bzw. etwas abschwächt.

Bei Rechtecksignalen mit sehr niedriger Frequenz ist eine Dachschräge der Impulse dabei nicht zu vermeiden. In Stellung 0 des Schalters AC-0-DC kann man schnell den Nullpegel bestimmen. In dieser Stellung ist der Verstärkereingang nicht mit dem Eingangssignal verbunden, sondern geerdet. Gleichzeitig wird der Trennkondensator entladen, damit die zu prüfende Schaltung nicht beschädigt werden kann.

## 2.2.4. TRIGGERUNG

### 2.2.4.1. Allgemeines

Um ein stillstehendes Bild zu erhalten, muss die horizontale Ablenkung immer beim selben Punkt des Signals gestartet werden. Deshalb wird der Zeitablenkgenerator von einem kurzen Triggerimpuls gestartet, der in der Triggereinheit geformt und von einem Signal gesteuert wird, das dem vertikalen Eingangssignal oder einer externen Spannungsquelle entnommen wird.

### 2.2.4.2. Triggerkopplung

- AC** Wenn das Eingangssignal eine Gleichspannungskomponente enthält, kommt es vor, dass mit dem Pegel-  
potentiometer nicht der richtige Gleichspannungspegel für den Schmitt-Trigger eingestellt werden  
kann. In diesem Fall ist mit Wechsellspannungskopplung zu arbeiten. Die Wechsellspannungskopplung  
erhält man durch Einfügen eines Kondensators in die Triggerleitung. Dies hat den Vorteil, dass die  
Gleichspannungskopplung für die Y-Kanäle erhalten bleibt.
- DC** Eine Gleichspannungskopplung ist zweckmässig, wenn der Mittelwert des Signals schwankt. Diese Art  
von Signalen tritt oft in Digitalsystemen auf. Bei Wechsellspannungskopplung würde der Triggerpunkt  
dann nicht festliegen, wodurch das Oszillogramm zu zittern beginnt oder die Triggerung ganz ausfällt.

### 2.2.4.3. Triggerpegel

Bei einem komplizierten Signal mit mehreren periodisch auftretenden nicht identischen Spannungsformen  
muss die Zeitablenkung immer bei derselben Spannungsform gestartet werden, um ein stillstehende Oszillo-  
gramm zu erhalten. Dies ist möglich, wenn irgendein Teil des Kurvenzuges eine abweichende Amplitude hat.  
Mit dem Knopf LEVEL kann der Triggerpegel so eingestellt werden, dass nur diese grössere Spannungs-  
abweichung den eingestellten Pegel überschreitet.

Die PegelEinstellung ist auch sehr nützlich, wenn zwei Signale genau verglichen werden sollen, z.B. bei Phasen-  
messungen. Mit der PegelEinstellung kann der Startpunkt der beiden Kurven so gegeneinander verschoben  
werden, dass er auf der mittleren Rasterlinie liegt.

### 2.2.4.4. Automatische Triggerung

Die automatische Triggerung – Schalter AUTO gedrückt – wird wegen der einfachen Bedienung am häufigsten  
gewählt. Bei dieser Triggerart können die verschiedenartigsten Kurvenformen abgebildet werden, ohne dass  
irgendeines der Triggerbedienungsorgane eingestellt werden muss. Wenn kein Triggersignal vorhanden ist, bleibt  
auf dem Schirm eine Nulllinie sichtbar und erleichtert damit den Nullpunktvergleich. Bei dieser Triggerart lässt  
sich der Pegel über den Spitze-Spitze-Wert der Wechsellspannungskomponente des Signals einstellen. Wenn  
keiner der Schalter AUTO, AC, DC oder TV gedrückt ist, triggert der Oszillograf automatisch, aber über den  
gesamten zur Verfügung stehenden Pegelbereich. Dies hat den Vorteil, dass immer eine Linie auf dem Schirm  
zu sehen ist, auch wenn keine der Triggertasten gedrückt ist.

### 2.2.4.5. Externe Triggerung

Mit externer Triggerung wird bei Signalen mit stark schwankender Amplitude gearbeitet, sofern ein Signal mit  
konstanter Amplitude und gleicher Frequenz zur Verfügung steht. Noch wichtiger ist die externe Triggerung  
bei komplexen Signalen und Impulsmustern, um Doppelbilder zu vermeiden.

Man braucht dann nicht bei jeder Änderung des Eingangssignals den Triggerpegel neu einzustellen.

### 2.2.4.6. Triggerung mit Netzfrequenz

In diesem Falle ist das Triggersignal eine Sinusspannung mit Netzfrequenz. Diese Triggerquelle kann verwendet  
werden, wenn das zu untersuchende Signal mit der Netzfrequenz gekoppelt ist; z.B. zur Untersuchung der  
Brummkomponente eines Signals.

### 2.2.4.7. Triggerung mit Fernsehsignalen

Der Oszillograf kann mit Zeilen- oder Bildsynchronimpulsen von Fernsehsignalen getriggert werden. In den  
Stellungen 0,5 s/cm bis 50  $\mu$ s/cm des Schalters TIME/cm werden die Bildsynchronimpulse und in den Stel-  
lungen 20  $\mu$ s/cm bis 0,2  $\mu$ s die Zeilensynchronimpulse des Signals getriggert. Der Schalter für die Triggerflanke  
ist der Polarität des Videosignals entsprechend einzustellen.

### 2.2.5. DEHNUNG DER ZEITABLENKUNG

Die Dehnung wird mit einem Schiebeschalter eingestellt. Wenn dieser Schalter sich in Stellung x5 befindet, ist ein 5x schnellerer Zeitmassstab eingestellt. In dieser Stellung gilt der eingestellte Zeitmassstab geteilt durch 5.

### 2.2.6. HELBIGKEITSSTEUERUNG

Soll das Oszillogramm ohne Änderung der Kurvenform eine zusätzliche Information erhalten, kann die Helligkeit des Elektronenstrahls mit einer externen Spannung herabgesetzt werden. Das externe Signal ist hierfür an die Buchse Z MOD an der Rückseite des Oszillografen anzuschliessen. Die für eine sichtbare Helligkeitsmodulation benötigte Spannung hängt von der eingestellten Grundhelligkeit ab. Bei mittlerer Helligkeit des Elektronenstrahls genügt eine Spannung von +20 V<sub>SS</sub> für eine gut sichtbare Helligkeitssteuerung.

### 2.2.7. DIE ZWEISTRAHLRÖHRE

In dem Oszillografen PM 3233 wird eine Zweistrahlröhre verwendet, deren beide Elektronenstrahlen in einer gemeinsamen Elektronenkanone erzeugt, aber unabhängig voneinander abgelenkt werden können. Diese Anordnung ist als Spaltstrahlröhre (split-beam tube) bekannt.

Bei dieser Röhre laufen die beiden Strahlspuren absolut parallel, da sie an einem einzigen Punkt erzeugt und von einem gemeinsamen Horizontalverstärker abgelenkt werden. Weil die beiden Elektronenstrahlen in nur einer Kanone erzeugt werden, sind sie gegeneinander nur gering verzerrt.

Die Spaltstrahlröhre ist vor allem für die Darstellung von Signalen mit einer niedrigen Wiederholungsfrequenz und relativ hohen Ablenkgeschwindigkeiten geeignet, da sie gleichsam als eine Elektronenstrahlröhre betrachtet werden kann, die von einem Elektronenschalter mit unendlich hoher Schaltfrequenz gesteuert wird.

Um die Helligkeit beider Strahlen einander anzugleichen und einstellen zu können sind an der Katodenstrahlröhre zwei Magnete symmetrisch angebracht. Beide Magnete sind ab Fabrik auf gleiche Helligkeit eingestellt. Mit Hilfe eines Schraubenziehers lässt sich Magnet 2 durch eine Öffnung in die Bodenplatte des Oszillografen nachjustieren.

## 2.3. Beschreibung des Blockschaltbildes (Abb. Seite 26)

### 2.3.1. Y-ACHSE

Der Oszillograf PM 3233 besitzt zwei identische gleichspannungsgekoppelte Y-Verstärker, mit denen zwei Signale gleichzeitig dargestellt werden können. Jeder Verstärker enthält einen Abschwächer, einen Quellenfolger mit Schutzschaltung, einen Vorverstärker, eine Driftkompensation, eine Triggerentnahmestufe, eine Verzögerungsschaltung und einen Endverstärker.

In diesem Gerät befindet sich die Verzögerungsschaltung (für beide Kanäle  $Y_A$  und  $Y_B$ ) zwischen der Triggerentnahmestufe und dem Endverstärker, welche ein Teil der Verzögerungseinheit ist.

Die Schutzschaltung verhindert eine Beschädigung des Feldeffektransistors in der Eingangsstufe durch zu hohe Eingangsspannungen.

Die Driftkompensationsschaltung reduziert die bei hochempfindlichen Verstärkern unvermeidliche Drift.

Die Triggerentnahmestufe liefert bei interner Triggerung ein Triggersignal an den Triggervorverstärker und koppelt ausserdem das Signal an den Y-Endverstärker. Wenn das Gerät als X-Y-Oszillograf verwendet wird, kann das Signal von Kanal  $Y_A$  an den X-Endverstärker angeschlossen werden. Vom Y-Endverstärker gelangt das Signal an die Y-Ablenkplatten der Elektronenstrahlröhre.

Die Verzögerungsschaltung gestattet die Wiedergabe der Vorderflanke schneller Vorgänge auf dem Bildschirm.

### 2.3.2. TRIGGERUNG

Das Triggersignal kann entweder einem Y-Verstärker, einer externen Quelle oder intern dem Netz entnommen werden. Letzteres ist nicht möglich, wenn das Gerät mit einer externen Gleichspannung betrieben wird. Das Triggersignal kommt an den Triggerimpulsformer, der eindeutige Triggerimpulse zum Starten des Zeitablenkgenerators liefert. Die Triggereinheit enthält ausserdem eine Synchronimpulstrennstufe für Fernsehsignale, so dass auch mit diesen Signalen eine Triggerung möglich ist.

### 2.3.3. ZEITABLENKUNG

Der Zeitablenkgenerator ist ein Konstantstromintegrator und liefert zwei Ausgangsspannungen. Eine Sägezahnspannung für den X-Endverstärker und die Ausgangsbuchse an der Rückseite des Gerätes eine Torimpuls, der für die Helltastung der Elektronenstrahlröhre während der Ablenkung sorgt.

### 2.3.4. X-ACHSE

Der X-Endverstärker erhält sein Eingangssignal entweder vom Zeitablenkgenerator oder über den  $Y_A$ -Kanal von einer externen Spannungsquelle. Von X-Verstärker gelangt das Signal an die horizontalen Ablenkplatten der Elektronenstrahlröhre.

### 2.3.5. SCHALTUNG DER ELEKTRONENSTRAHLRÖHRE

Die Elektronenstrahlröhre ist eine Spaltstrahlröhre mit nur je einer Einstellung für die Helligkeit und die Fokussierung. Die Kathode der Elektronenstrahlröhre liegt über einen Kondensator an der Buchse für externe Helligkeitssteuerung. Die Hochspannungen für diese Röhre werden von einem Spannungswandler erzeugt, der auch die übrigen Speisespannungen liefert.

## 2.4. Kurze Prüfanleitung

### 2.4.1. AUSGANGSSTELLUNG DER BEDIENUNGSORGANE

- Die Tasten  $Y_A$  SK4 + SK8 und BEAM SELECTOR A SK14 und B SK15 gedrückt.
- Schalter SK2 TIME/cm in Stellung 0,1 ms/cm.
- Schalter SK17 und SK18 AMPL in Stellung 0,1 V/cm.
- Schalter SK1 MAGN in x1.
- Potentiometer POSITION R1, R11 und R12 in ihre Mittelstellungen.
- Potentiometer INTENS R10 an den rechten Anschlag.
- Potentiometer TIME/cm und AMPL R2, R4 und R5 in Stellung CAL.

Sofern nicht anders angegeben, müssen die Bedienungsorgane sich immer in derselben Stellung wie bei der vorausgegangenen Prüfung befinden.

### 2.4.2. EINSTELLUNGEN DER ELEKTRONENSTRAHLRÖHRE

- Mit den Potentiometern FOCUS (R9) und INTENS (R10) eine klare und gut sichtbare Linie einstellen.
- Die beiden Zeitablenklinien mit den Potentiometern POSITION (R1, R11 und R12) zentrieren.
- Prüfen, ob die Zeitablenklinie genau parallel zu den waagerechten Rasterlinien verläuft. Eine Korrektur ist mit Potentiometer R813 möglich (Abb. 3.11.).

### 2.4.3. Y-KANÄLE

Es wird die Prüfung von Kanal  $Y_A$  beschrieben, die für  $Y_B$  geltenden Werte stehen in Klammern.

- BEAM SELECTOR B SK15 (A SK14) lösen.
- Schalter AC-0-DC SK16 und SK19 in Stellung 0.
- Schalter AMPL SK17 (SK18) in Stellung 2 mV/cm.
- Prüfen, ob die Zeitbasislinie innerhalb 4 mm von der Schirmmitte bleibt. Korrektur mit Potentiometer DC BAL R6 (R7).
- Schalter AC-0-DC SK16 (SK19) in Stellung DC.
- Prüfen, ob die Zeitbasislinie nicht mehr als 4 mm springt. Korrektur mit Potentiometer R126 (R326), Abb. 3.13.
- Schalter AMPL SK17 (SK18) in Stellung 0,1 V/cm.
- Eine Rechteckspannung von  $600 \text{ mV}_{ss} \pm 0,5 \%$ , 2 kHz, an die Eingangsbuchse  $Y_A$  ( $Y_B$ ) BU3 (BU5) anschliessen.
- Prüfen, ob die Höhe des Oszillogramms  $6 \text{ cm} \pm 2 \%$  beträgt. Korrektur mit R111 (R311), Abb. 3.13.
- Eine Sinusspannung von  $600 \text{ mV}_{ss} \pm 0,5 \%$ , an die Eingangsbuchse  $Y_A$  ( $Y_B$ ) BU3 (BU5) anschliessen.
- Prüfen, ob die Höhe des Oszillogramms wenigstens 4,2 cm beträgt.

### 2.4.4. X VIA $Y_A$

- BEAM SELECTOR A SK14 und B SK15 drücken.
- Schalter TIME/cm SK2 in Stellung X via  $Y_A$ .
- Schalter AC-0-DC SK19 in Stellung 0.
- Eine Rechteckspannung von  $600 \text{ mV}_{ss} \pm 0,5 \%$ , 2 kHz, an Eingang  $Y_A$  BU3 anschliessen.
- Prüfen, ob die Breite des Oszillogramms  $6 \text{ cm} \pm 3 \%$  beträgt. Korrektur mit Potentiometer R601 (Abb. 3.12.).

#### 2.4.5. ZEITABLENKUNG

- Den Zeitmasstab in Stellung  $20\ \mu\text{s}$  des Schalters TIME/cm SK2 mit Zeitmarken prüfen, Toleranz  $\pm 5\%$ . Korrektur mit Potentiometer R534 (Abb. 3.12.).
- Die übrigen Zeitmasstäbe prüfen, Toleranz  $\pm 5\%$ .

#### 2.4.6. TRIGGERUNG

- Eine Sinusspannung von  $100\ \text{mV}_{\text{ss}}$  10 MHz, an Eingang  $Y_A$  BU3 anschliessen.
- Prüfen, ob sich mit Hilfe von Potentiometer LEVEL R3 ein stillstehendes Bild einstellen lässt.

# 1. Généralités

## 1.1. Introduction

L'oscilloscope PM 3233 10 MHz a été conçu pour l'usage en laboratoire, l'entretien et l'enseignement.

Les amplificateurs verticaux sont équipés d'un circuit de réduction de dérive et d'une entrée à transistor à effet de champ complètement protégé contre la surcharge.

Tous les circuits sont entièrement transistorisés et les transistors sont montés sur support pour permettre un entretien rapide.

L'appareil est pourvu d'un dispositif automatique permettant le déclenchement sur les impulsions de synchronisation (ligne et trame) d'un signal télévision.

L'oscilloscope peut être alimenté en alternatif secteur ou en continu externe.

Le PM 3233 est équipé d'une unité de ligne à retard qui produit un retard de signal pour les voies  $Y_A$  et  $Y_B$ .

Fig. 1.1. Oscilloscope à deux faisceau (PM 3233)

## 1.2. Caractéristiques techniques

Seules les valeurs indiquées avec tolérance sont garanties par l'usine pour les tensions secteur nominales.  
Les chiffres sans tolérance ne servent que d'orientation et correspondent aux caractéristiques d'un appareil moyen.

## 1.3. Accessoires

### 1.3.1. ACCESSOIRES STANDARD

1 Couvercle frontal avec plane pour deux sondes passives et deux adaptateurs BNC 4 mm  
2 Adaptateurs BNC 4 mm PM 9051  
1 Notice d'emploi

### 1.3.2. ACCESSOIRES FACULTATIFS

Sondes passives (10 : 1)	: PM 9326 ou PM 9327
Sondes passives (10 : 1)	: PM 9336 ou PM 9336L
Sonde passive (1 : 1)	: PM 9335
Sonde passive 2 kV (100 : 1)	: PM 9358
Pincettes miniatures pour sondes	: PM 9333
Appareil de photographie d'oscillogrammes	: PM 9380
Adaptateur (oscilloscope - PM 9380)	: PM 9379

Voir également chapitre 3.5. "Information concerning accessories".

## 2. Mode d'emploi

### 2.1. Installation

#### 2.1.1. DEPOSE ET REPOSE DU COUVERCLE FRONTAL

Dépose: — Tourner le bouton au centre du couvercle d'un quart de tour vers la gauche  
— Enlever le couvercle

Repose: — Aligner la clef du bouton de verrouillage avec la fente pratiquée dans la plaque de texte de l'appareil  
— Fixer le couvercle à l'avant de l'oscilloscope  
— Enfoncer le bouton et le tourner d'un quart de tour vers la droite.

#### ATTENTION

Cet appareil produit de hautes tensions et ne peut être utilisé avec les couvercles déposés. La fiche secteur ou la source de tension externe doit être déconnectée avant tout entretien et tous les points à haute tension déchargés.

#### 2.1.2. ADAPTATION AU SECTEUR ET FUSIBLES

Avant l'enclenchement, l'instrument doit être réglé sur la tension secteur locale à l'aide de l'adaptateur de tension situé à l'arrière de l'instrument.

Il est possible de régler l'instrument sur 110 V, 127 V, 220 V et 240 V à l'aide d'un tournevis. La tension sélectionnée est visible par l'ouverture à l'arrière.

Le fusible thermique est monté entre les enroulements du transformateur secteur. Il peut être remplacé après démontage du couvercle arrière (3 vis "X", Fig. 2.1.).

Les bornes "N" et "1" (voir figure 3.20. et 3.43.) doivent être dessoudées; afin d'enlever le fusible, courber l'enveloppe légèrement vers l'extérieur de sorte que la goupille d'arrêt soit libérée.

Un nouveau fusible s'extraît de son boîtier de la même façon que décrit précédemment. Il est ensuite poussé au même endroit que l'ancien, jusqu'à ce que la goupille d'arrêt s'adapte dans le trou, la cosse étant dirigée vers la borne "N". Souder ensuite les bornes "N" et "1", l'appareil est alors prêt à l'usage.

Fig. 2.1. Vue arrière montrant les douilles

### 2.1.3. ALIMENTATION PAR UNE SOURCE CONTINUE EXTERNE

L'appareil peut être alimenté par une source continue externe de 22 V à 30 V; 0,85 A. Cette tension doit être appliquée à la douille BU8 EXT. D.C. SUPPLY.

LA BORNE POSITIVE DE LA SOURCE DE TENSION DOIT ETRE CONNECTEE A LA TERRE' ETANT DONNE QUE LA PARTIE POSITIVE DE L'ALIMENTATION EST CONNECTEE AU CHASSIS.

L'appareil est protégé contre la connexion inverse. En cas d'alimentation continue externe, l'appareil est protégé par le fusible VL802 (Fig. 2.3.) sur la platine d'alimentation et accessible après dépose du couvercle arrière. VL802 est un fusible 1,25 à action différée.

Fig. 2.3. Vue arrière montrant le fusible VL802

### 2.1.4. MISE A LA TERRE

Pour la sécurité l'oscilloscope doit être connecté à la terre par l'intermédiaire de la borne de terre arrière (symbole ) ou du cordon secteur à condition que la douille d'alimentation soit équipée d'une connexion de terre.

Faire en sorte que la ligne de terre vers l'oscilloscope ne soit pas interrompue par l'usage d'un câble ou d'un dispositif prolongement non raccordée à un conducteur à la terre.

### 2.1.5. ENCLENCHEMENT

En cas de branchement au secteur, l'appareil est enclenché par le commutateur secteur de la commande ILLUM.

Le cordon secteur est placé dans un compartiment au fond de l'appareil.

En cas d'alimentation continue externe, le commutateur secteur n'a aucune fonction et l'appareil est enclenché dès que la source externe est connectée. Dans les deux cas, la position enclenchée par la lampe témoin blanche.

L'appareil peut être utilisée dans toutes les positions en tenant compte toutefois de la bonne circulation d'air. Pour les conditions thermiques, voir section 1.2.8.2.

### 2.1.6. PASSAGE D'UN ENDROIT FROID DANS UN ENDROIT CHAUD

A la section 1.2. il est spécifié que l'appareil fonctionne dans les limites des spécifications après une période de chauffage de cinq minutes et à une température ambiante entre +5 °C et +40 °C.

Il y a cependant une exception. Si, après avoir laissé l'oscilloscope dans sa voiture alors qu'il gèle, on le place le lendemain matin dans une pièce à 25 °C, il y aura condensation sur les composants.

Les résistances à haute impédance perdent leur propriété ohmique du fait des courants de fuite dus à la condensation; dans ce cas, l'oscilloscope ne fonctionne pas selon les spécifications. Il faut alors attendre environ deux heures avant que la condensation soit éliminée et que l'oscilloscope puisse être utilisé.

## 2.2. Manipulation

Avant l'enclenchement s'assurer que l'oscilloscope a été installé correctement conformément au chapitre 2.1. Installation, et que toutes les précautions ont été prises.

### 2.2.1. COMMANDES ET DOUILLES (Fig. 2.2. page 17)

X POSITION (R1)	Commande continuellement variable pour positionnement horizontal de la représentation.
MAGN. (SK1)	Cette commande comporte un commutateur pour agrandissement 5x de la base de temps.
TIME/cm (SK2)	Commande de coefficient de temps de la base de temps; commutateur à 21 positions, dont une position pour déviation externe X (X via $Y_A$ ).
CAL.-TIME/cm (R2/SK3)	Commande continuellement variable des coefficients de temps. En position CAL. les coefficients de temps sont étalonnés.
LEVEL (R3)	Commande continuellement variable afin de sélectionner le niveau auquel le générateur de base de temps démarre.
CAL. (BU1)	Sortie pour tension rectangulaire de 600 mV <sub>CC</sub> à des fins d'étalonnage.
TRIGGERING (SK4 ...13)	Commandes pour source, pente et mode de déclenchement; bouton-poussoir à 10 positions.
$Y_A$ (SK4)	Signal de déclenchement interne dérivé du canal $Y_A$
$Y_B$ (SK5)	Signal de déclenchement interne dérivé du canal $Y_B$
EXT. (SK6)	Signal de déclenchement dérivé d'une tension appliquée à la douille d'entrée TRIGG.
MAINS (SK7)	Signal de déclenchement dérivé d'une tension interne avec la fréquence secteur. Cette source de déclenchement n'exerce aucune fonction lorsque l'appareil est alimenté par une tension continue externe.
+	Pour déclenchement sur la pente positive du signal.
- (SK9)	Pour déclenchement sur la pente négative du signal.
AUTO (SK10)	Pour base de temps libre en l'absence de signaux de déclenchement et de limitation automatique de la gamme de commande LEVEL.
AC (SK11)	Déclenchement avec condensateur de couplage sur le chemin du signal de déclenchement.
DC (SK12)	Couplage direct pour déclenchement sur une tension variant lentement, ou pleine largeur de bande.
TV (SK13)	Permet de déclenchement sur impulsions de ligne ou de trame des signaux de télévision, en fonction de la position du commutateur SK2. Déclenchement sur les impulsions de trame en positions 50 $\mu$ s/cm à 0,5 s/cm et sur les impulsions de ligne en positions 0,2 $\mu$ s/cm à 20 $\mu$ s/cm.
TRIGG (BU2)	Connectuer BNC d'entrée pour signaux de déclenchement externe.
BEAM SELECTOR A (SK14)	Lorsque ce bouton-poussoir est enfoncé, la déviation verticale s'obtient par le signal appliqué à l'entrée de voie $Y_A$ .

BEAM SELECTOR B (SK15)

Lorsque ce bouton-poussoir est enfoncé, la déviation verticale s'obtient par le signal appliqué à l'entrée de voie  $Y_B$ .

Si les commutateur A (SK 14) et B (SK 15) sont tous deux enfoncés, la déviation verticale par le signal appliqué à l'entrée de voie  $Y_A$  et par celui appliqué à l'entrée de voie  $Y_B$ .

AC-0-DC (SK 16 et 19)

Commutateur à trois positions pour couplage de signal

AC : par l'intermédiaire d'un condensateur de couplage

0 : interruption de la connexion entre la douille d'entrée et le circuit d'entrée, ce dernier étant mis à la terre

DC : couplage direct

AMPL. (SK 17 et 18)

Commande des coefficients de déviation, commutateur à 12 positions.

CAL.-AMPL. (R4 et 5)

Commande continuellement variable des coefficients de déviation verticale. En position CAL, le coefficient de déviation est étalonné.

DC BAL. (R6 et 7)  
(réglage par tournevis)

Commande continuellement variable pour balance de tension continue de l'amplificateur vertical.

ILLUM. (SK20 et R8)

Commande continuellement variable pour illumination du graticule. Comporte le commutateur secteur.

FOCUS (R9)

Commande continuellement variable pour focalisation du faisceau.

INTENS (R10)

Commande continuellement variable pour brillance de trace.

1 MOhm — 20 pF (BU3 et 5)

Connecteur BNC d'entrée pour signaux de déviation verticale.

POSITION (R11 et 12)

Commande continuellement variable pour positionnement vertical de la représentation.

$\perp$  (BU4)

Douille de terre

A l'arrière de l'appareil (Fig. 2.1.):

TB OUT (BU6)

Connecteur BNC de sortie en dents de scie

Z MOD (BU7)

Connecteur BNC d'entrée pour tension de modulation d'intensité

EXT. DC SUPPLY (BU8)

Douille d'entrée pour alimentation continue

## 2.2.2. REGLAGES PRELIMINAIRES

Un temps de chauffage de 5 minutes est nécessaire avant de procéder à une mesure. Ce temps n'inclut pas le temps de rétablissement lorsque l'appareil sort d'un endroit froid (voir également section 2.1.6.).

- En cas d'alimentation secteur:  
Vérifier si l'adaptateur de tension est réglé sur la tension locale. Si nécessaire, régler l'adaptateur sur la tension correspondante conformément à la section 2.1.2.  
Enclencher l'appareil.
- En cas d'alimentation continue externe:  
Vérifier si la source externe est connectée correctement avec borne positive à la terre.
- Mettre la commande FOCUS (R9) et la commande INTENS. (R10) en positions médianes.
- Enfoncer les bouton BEAM SELECTOR A (SK 14) et B (SK 15). Ne pas oublier qu'il n'y a pas de spot tant que le bouton BEAM SELECTOR n'est pas enfoncé.
- Choisir la source, la pente et le mode de déclenchement. Si aucun bouton TRIGG. n'est enfoncé, l'oscilloscope déclenche sur le signal  $Y_A$ , sur la pente positive et en mode AUTO sans limitation de gamme de niveau.
- Afficher les deux traces à l'aide des commandes Y POSITION R11 et R12.

L'oscilloscope est prêt à l'usage. Pour la correction de la balance continue, voir section 3.2.4.2.

## 2.2.3. ENTREES $Y_A$ ET $Y_B$ ET LEURS POSSIBILITES

Le PM 3233 est pourvu de deux voies verticales identiques pouvant être utilisés pour des mesure YT avec le générateur de base de temps ou des mesures XY pour des fréquences allant jusqu'à 1 MHz.

### 2.2.3.1. Mesures YT

Pour représenter un signal, une des deux voies verticales peut être sélectionné à l'aide de BEAM SELECTOR A (SK 14) ou BEAM SELECTOR B (SK 15). Lorsque les deux bouton-poussoirs A et B (SK 14 et SK 15) sont enfoncés, deux signaux peuvent être représentés simultanément. Le coefficient de déviation Y peut être réglé individuellement pour chaque voie.

### 2.2.3.2. Mesures XY

Lorsque le commutateur TIME/cm SK2 est mis en position X via  $Y_A$ , le générateur de base de temps est mis hors circuit. Le signal de voie  $Y_A$  est représenté horizontalement. Les commandes  $Y_A$  (à l'exception du potentiomètre POSITION R11) commandent alors la déviation X. Le positionnement de la trace en sens horizontal est encore possible avec la commande POSITION R1. Le commutateur MAGNIFIER x5 (SK1) est hors service. Dans ce mode, des mesures XY sont possibles jusqu'à une fréquence de 100 kHz.

### 2.2.3.3. Influence du commutateur AC-0-DC

Les signaux à étudier peuvent être appliqués à la douille d'entrée  $Y_A$  (BU3) et/ou à la douille d'entrée  $Y_B$  (BU5).

Le commutateur AC-0-DC doit être réglé en position AC ou DC en fonction de la composition du signal. En position DC l'entrée est couplée directement avec l'amplificateur Y. Etant donné que l'amplificateur est couplé en continu, la largeur de bande totale de l'appareil est disponible. Ceci signifie que les tensions d'entrée totales sont conduites aux plaques de déflexion, ce qui implique que les composantes continues correspondent à des décadres de trace sur l'écran.

Ceci peut entraîner des difficultés lorsque des signaux alternatifs superposés à de hautes tensions continues doivent être représentés.

Pour visualiser le signal alternatif dans ces cas, une plus forte atténuation est nécessaire, le signal alternatif étant alors fortement atténué.

Au cas où le commutateur AC-0-DC est en position AC, un condensateur de blocage est connecté entre la douille d'entrée et l'amplificateur Y. De ce fait, les tensions continues sont bloquées, mais les basses fréquences sont supprimées ou atténuées. Lorsque des signaux rectangulaires à basse fréquence sont représentés, on obtient une certaine pente de toit.

En position 0 du commutateur AC-0-DC, il est possible de déterminer rapidement le niveau continu zéro.

Dans cette position, la connection entre l'entrée de l'amplificateur et la douille d'entrée est interrompue. Le condensateur de blocage est également déchargé afin d'empêcher tout endommagement du circuit testé à la suite d'une haute charge éventuelle.

## 2.2.4. DECLENCHEMENT

### 2.2.4.1. Généralités

Pour obtenir une trace stationnaire, la déviation horizontale doit toujours être démarrée à un point fixe du signal. Le générateur de base de temps est donc démarré par des impulsions de déclenchement étroites produites dans une unité de déclenchement et contrôlé par un signal provenant du signal d'entrée vertical ou d'une source externe.

### 2.2.4.2. Accouplement de déclenchement

**AC** Lorsque la tension du signal contient un composant continu, le déclenchement peut cesser lorsque le potentiomètre de niveau ne produit plus le niveau requis par le déclencheur de Schmitt. Dans ce cas, il est utile d'appliquer un couplage capacitif. Le couplage capacitif s'obtient en insérant un condensateur sur la piste de déclenchement. Ceci signifie que le signal peut encore être couplé en continu avec les canaux Y.

**DC** Le couplage continu est utile lorsque la valeur moyenne du signal varie. Cette sorte de signal apparaît souvent dans des systèmes digitaux.

Avec le couplage capacitif le point de déclenchement n'est pas fixe, ce qui entraînerait l'instabilité de la base de temps ou même une certaine perte de déclenchement.

### 2.2.4.3. Niveau de déclenchement

En cas de signal compliqué dans lequel un certain nombre de tensions non-identiques apparaissent périodiquement, l'axe de temps doit toujours être démarré avec la même tension, et ce afin d'obtenir une trace stationnaire.

Ceci est possible lorsqu'un des détails a une amplitude différente.

Avec le bouton LEVEL, le niveau de déclenchement peut être réglé de telle sorte que seule cette plus grande variation de tension passe ce niveau. La commande LEVEL est également très utile lorsque deux signaux doivent être comparés exactement, pour des mesures de phase par exemple. La commande LEVEL permet de décadrer le point de démarrage des traces exactement sur la ligne de graticule centrale.

### 2.2.4.4. Déclenchement automatique

Le déclenchement automatique (commutateur AUT enfoncé) est surtout utilisé pour sa simplicité. Dans ce mode il est possible de représenter une grande variété d'impulsions d'amplitude et de forme différentes, et ce sans devoir actionner une des commandes de déclenchement. Lorsqu'aucun signal de déclenchement n'est présent, une ligne de base de temps reste visible sur l'écran. Ceci est utile à des fins de référence du zéro. Dans ce mode de déclenchement, le niveau peut être réglé sur la valeur crête-à-crête du composant alternatif du signal. Si aucun des commutateurs AUTO, AC, DC ou TV n'est enfoncé, l'oscilloscope fonctionne en mode automatique, la gamme de niveau totale étant alors disponible. Une trace est alors toujours visible même lorsqu'aucun bouton-poussoir TRIGG. n'est enfoncé.

### 2.2.4.5. Déclenchement externe

Le déclenchement externe est appliqué pour des signaux à amplitude fortement variable, lorsqu'un signal d'amplitude fixe et de fréquence égale est disponible. Le déclenchement externe est même plus important en cas de signaux et des courbes d'impulsions complexes.

Le déclenchement externe peut alors être utilisé pour éviter la double trace.

C'est pourquoi il n'est pas nécessaire de rajuster le réglage de niveau à chaque variation du signal d'entrée.

### 2.2.4.6. Déclenchement avec fréquence secteur

Dans ce cas, le signal de déclenchement est une sinusoïdale à fréquence secteur.

Cette source de déclenchement est utile lorsque la fréquence du signal observé est couplée avec la fréquence secteur. Par exemple, il est possible de reconnaître le composant de bruit d'un signal en déclenchant ce composant.

#### 2.2.4.7. Déclenchement avec signaux de télévision

Il est possible de déclencher sur les impulsions de synchronisation (ligne ou trame) des signaux télévision. En positions .5 s à 50  $\mu$ s du commutateur TIME/cm, le déclenchement se fait sur les impulsions de synchronisation, de trame et en positions 2  $\mu$ s à .2  $\mu$ s sur les impulsions sync de ligne. La position des commutateurs de pente de déclenchement doit correspondre à la polarité de l'information vidéo de signal.

#### 2.2.5. AGRANDISSEUR DE BASE DE TEMPS

Cet agrandisseur est piloté par un commutateur push-pull. Lorsque ce commutateur est en position x5, la vitesse de balayage de la base de temps est agrandie 5 fois. Dans cette position, le temps de balayage est déterminé en divisant par cinq la valeur indiquée par TIME/cm.

#### 2.2.6. MODULATION Z

Afin d'amener des informations supplémentaires à la représentation du t.r.c. sans modifier la forme d'onde, la luminosité de la trace peut être diminuée par une tension externe. Ce signal doit être conduit à la douille Z MOD à l'arrière de l'oscilloscope. La tension requise pour modulation visible de la luminosité dépend de la position de la commande INTENS. Pour une luminosité moyenne de la trace, une tension de +20 V<sub>CC</sub> suffit à obtenir une modulation Z bien visible.

#### 2.2.7. TUBE A DEUX FAISCEAUX

Le tube à rayons cathodiques utilisé dans l'oscilloscope PM 3233 est un tube à deux faisceau dans lequel deux faisceaux sont engendrés dans un canon et pouvant être déviés indépendamment.

Ce type de tube est également connu sous le nom de tube split-beam.

Dans ce tube, deux lignes de temps sont exactement en parallèle car elles proviennent d'un point et dépendent d'un amplificateur horizontal commun. Etant donné que les deux traces proviennent d'un seul canon, elles présentent peu de distorsions l'une par rapport à l'autre.

Le tube split-beam est approprié pour la représentation de signaux à faible taux de répétition et à vitesses relativement rapides, car sa "fréquence de découpeur" est infiniment haute.

Afin d'égaleriser et de pouvoir régler la luminosité des deux faisceaux deux aimants sont montés symétriquement sur le T.R.C. Les deux aimants sont réglés à l'usine sur une luminosité égale.

L'aimant 2 peut être rajusté à l'aide d'un tournevis par une ouverture pratiquée dans la plaque de fond de l'oscilloscope.

## 2.3. Description du schéma synoptique (Fig. page 26)

### 2.3.1. AXE Y

L'oscilloscope PM 3233 est composé de deux amplificateurs verticaux identiques à couplage continu permettant la représentation simultanée de deux signaux.

Chaque amplificateur comporte atténuateur à plots d'entrée, une source follower avec circuit de protection, un préamplificateur et un circuit de réduction de dérive, un étage sélectif de déclenchement un circuit de ligne à retard et un amplificateur de sortie. L'étage sélectif de déclenchement et l'amplificateur de sortie (pour canaux  $Y_A$  et  $Y_B$ ) sont couplés à l'aide du circuit de ligne à retard, qui fait partie de l'unité de ligne à retard.

Le circuit de protection empêche d'endommagement des transistors d'entrée à effet de champ à la suite d'une tension d'entrée trop élevée.

Le circuit de réduction de dérive réduit la dérive due à la haute sensibilité de l'amplificateur.

L'étage sélectif de déclenchement fournit un signal de déclenchement au préamplificateur en cas de déclenchement interne et accouple également le signal à l'amplificateur de sortie Y. Dans la voie  $Y_A$  le signal peut également être couplé à l'amplificateur de sortie X lorsque l'appareil est utilisé en tant qu'oscilloscope XY.

Le signal est conduit de l'amplificateur de sortie Y aux plaques de déflexion Y du tube à rayons cathodiques. La ligne à retard est appliquée afin de permettre l'affichage du flanc avant de phénomènes rapides sur l'écran.

### 2.3.2. DECLENCHEMENT

Un signal de déclenchement peut être obtenu à partir de chaque amplificateur vertical, d'une source externe ou du secteur (interne). Le dernier signal n'est pas disponible lorsque l'appareil est alimenté par une tension continue externe. Le signal de déclenchement est conduit au conformateur d'impulsions de déclenchement lesquelles permettent le démarrage du générateur de base de temps. L'unité de déclenchement comprend également un séparateur de synchronisation pour signaux de télévision de sorte que le déclenchement est possible à l'aide de ces signaux.

### 2.3.3. BASE DE TEMPS

Le générateur de base de temps est du type intégrateur à courant constant et fournit deux tensions de sortie. Une tension en dents de scie conduite à l'amplificateur de sortie X et à une borne de sortie à l'arrière de l'oscilloscope, et une impulsion de porte qui commande le faisceau du tube pendant le balayage.

### 2.3.4. AXE X

L'amplificateur de sortie X reçoit son signal d'entrée à partir du générateur de base de temps ou d'une source externe par l'intermédiaire de la voie  $Y_A$ .

Le signal est conduit de l'amplificateur X aux plaques de déviation horizontale du tube d'oscilloscope.

### 2.3.5. CIRCUIT DU TUBE A RAYONS CATHODIQUES

Le tube est du type split-beam avec une commande de brillance et une de focalisation. La cathode du tube est couplée en continu à la douille pour la modulation Z externe. Les hautes tensions pour tube sont engendrées par un convertisseur qui fournit également les autres tensions d'alimentation.

## 2.4. Bref processus de contrôle

### 2.4.1. POSITIONS DE DEMARRAGE DES ORGANES DE COMMANDE

- Boutons-poussoirs  $Y_A$  SK4, + SK8 et BEAM SELECTOR A SK14 & B SK15 enfoncés.
- TIME/cm SK2 en position .1 ms.
- Commutateurs AMPL SK17 & SK18 en position .1 V/cm.
- Commutateur MAGN SK1 en position x1.
- Potentiomètres POSITION R1, R11 et R12 en position centrale.
- Potentiomètre INTENS R10 en position extrême droite.
- Potentiomètres TIME/cm et AMPL R2, R4 et R5 en position CAL.

Les organes de commande doivent être dans la même position qu'au contrôle précédent, à moins qu'indiqué différemment.

### 2.4.2. POSITION DU TUBE A RAYONS CATHODIQUES

- Régler les potentiomètres FOCUS R9 et INTENS R10 en position adéquate.
- Centrer les deux lignes de base à l'aide des potentiomètres POSITION R1, R11 et R12.
- Vérifier si la ligne de base de temps est exactement en parallèle avec les lignes de graticule horizontales. La correction est possible avec R813 (Fig. 3.11.).

### 2.4.3. CANAUX VERTICAUX

Seul le contrôle du canal  $Y_A$  est décrit, les éléments de canal  $Y_B$  étant indiqués entre parenthèses.

- Relâcher BEAM SELECTOR B SK15 (A SK14).
- Commutateurs AC-0-DC SK16 & SK19 en position 0.
- Commutateur AMPL SK17 (SK18) en position 2 mV/cm.
- Vérifier si la ligne de base de temps reste au centre de l'écran. La correction est possible avec le potentiomètre DC BAL R6 (R7).
- Commutateur AC-0-DC SK16 (SK19) en position DC.
- Vérifier si la ligne de base de temps n'a pas bougé de plus de 4 mm. La correction est possible avec le potentiomètre R126 (R326), Fig. 3.13.
- Commutateur AMPL SK17 (SK18) en position .1 V/cm.
- Appliquer une tension rectangulaire de  $600 \text{ mV}_{\text{cc}} \pm 0,5 \%$ , 2 kHz à la douille d'entrée  $Y_A$  ( $Y_B$ ) BU3 (BU5).
- Vérifier si la hauteur de trace est de  $6 \text{ cm} \pm 2 \%$ . La correction est possible avec R111 (R311), Fig. 3.13.
- Appliquer une tension sinusoïdale de  $600 \text{ mV}_{\text{cc}} \pm 0,5 \%$ , 10 MHz à douille d'entrée  $Y_A$  ( $Y_B$ ) BU3 (BU5).
- Vérifier si la hauteur de trace est d'au moins 4,2 cm.

### 2.4.4. X VIA $Y_A$

- Enfoncer BEAM SELECTOR A SK14 et B SK15.
- Mettre le commutateur TIME/cm SK2 en position X via  $Y_A$ .
- Mettre le commutateur AC-0-DC SK19 en position 0.
- Appliquer une tension rectangulaire de  $600 \text{ mV}_{\text{cc}} \pm 0,5 \%$ , 2 kHz à la douille d'entrée  $Y_A$  BU3.
- Vérifier si la largeur de trace est de  $6 \text{ cm} \pm 3 \%$ . La correction est possible avec le potentiomètre R601 (Fig. 3.12.).

#### 2.4.5. BASE DE TEMPS

- Vérifier le coefficient de temps en position  $20\ \mu\text{s}$  du commutateur TIME/cm SK2 à l'aide des marqueurs de temps. Tolérance:  $\pm 5\%$ . La correction est possible avec le potentiomètre R534 (Fig. 3.12.).
- Vérifier les autres coefficients de temps; tolérance  $\pm 5\%$ .

#### 2.4.6. DECLENCHEMENT

- Appliquer une tension sinusoïdale de  $100\ \text{mV}_{\text{cc}}$ , 10 MHz à la douille d'entrée  $Y_A$  BU3.
- Vérifier s'il est possible de régler le potentiomètre LEVEL R3 pour représentation stationnaire.

### 3.1. Circuit description

#### 3.1.1. CHANNEL $Y_A$ VERTICAL AMPLIFIER

##### 3.1.1.1. General

The vertical amplifier provides control of the input coupling, Y deflection coefficient and gain. Furthermore, a drift-reduction circuit and a trigger pick-off stage are part of the amplifier circuitry.

**Fig. 3.1. Vertical amplifier, channel  $Y_A$**

##### 3.1.1.2. Input coupling

Input signals connected to  $Y_A$  socket BU3 can be a.c. coupled, d.c. coupled or internally disconnected. In position DC of AC-0-DC switch SK16, the input signal is coupled direct to the step attenuator.

In the AC position, there is a capacitor (C26) in the signal path.

This capacitor prevents the d.c. component of the input signal from being applied to the amplifier.

In position 0, the signal path between the input socket and the amplifier input is interrupted, the latter being earthed.

At the same time, blocking capacitor C26 is discharged via resistor R26, to prevent damage of the circuit under test by a possible high charge.

##### 3.1.1.3. Input attenuator

The input attenuator is a frequency-compensated, high-ohmic voltage divider with twelve positions.

Both attenuator sections contain trimmers which are adjusted for optimum square-wave response and others that maintain the same input capacitance (20 pF) for each position of AMPL. switch SK17.

The input capacitance of both channels can be equalized using trimmer C235.

The attenuator works in conjunction with a gain control in the preamplifier (see also section 3.1.1.5.).

The gain of the pre-amplifier is selected together with the relevant attenuator section, by means of AMPL. switch SK17.

##### 3.1.1.4. Input stage

Input source follower TS51 and emitter follower TS52 provide a high input impedance to the step attenuator and a low-impedance source to the pre-amplifier.

The input source-follower is protected by diodes GR53 and GR54.

If there is a maximum positive-going voltage change, the field-effect transistor can deal with it. If the change goes negative beyond the threshold established by zener diode GR54, diode GR53 starts conducting and the excess is short-circuit to earth.

The non-driven part of the input stage (TS62) is decoupled for high frequencies, by means of capacitor C59.

This part of the input stage receives the d.c. balance voltage and the drift-feedback voltage from the drift-feedback amplifier.

### 3.1.1.5. Pre-amplifier

The pre-amplifier comprises two amplifier stages, one with series feedback (TS53 & TS63) and one with shunt feedback (TS54). The overall gain of the pre-amplifier is chiefly determined by the ratio of the shunt feedback resistance (R97 & R99) and series-feedback resistance (resistance between the emitters of transistors TS53 and TS63). The latter resistance, and thus the overall gain of the pre-amplifier, can be varied by connecting resistors in parallel to resistor R62. These parallel resistors are selected, together with a section of the input attenuator, by means of AMPL. switch SK17. In this way twelve different deflection coefficients are obtained (see also section 3.1.1.3.).

Potentiometers R64 and R99 are pre-set controls for the gain of the pre-amplifier at different settings of AMPL. switch SK17.

### 3.1.1.6. Drift-reduction circuit

In the event of no drift phenomena in the pre-amplifier, attenuator R102, R40...R44 provides at junction R128-C67 a voltage which is exactly equal to, but in anti-phase with, the voltage at the gate of field-effect transistor TS51 (junction R52-R54). This is true because attenuator R102, R40...R44 is switched over together with the gain switch of the pre-amplifier. Junction R128-R52 will then be on earth level (virtual earth point).

When there is a drift phenomenon, junction R128-R52 carries half the drift voltage. This voltage is amplified by transistors TS71 and TS72 and, in the correct phase, applied to field-effect transistor TS62. The resulting feedback brings the output level of the amplifier back to 0 V. The d.c. level of the feedback is adjusted with DC BAL potentiometer R6.

In order to prevent the base currents of transistors TS71 and TS72 from flowing through high-ohmic resistors R128 and R52, they are compensated for by means of potentiometer R126 and resistors R127 and R129.

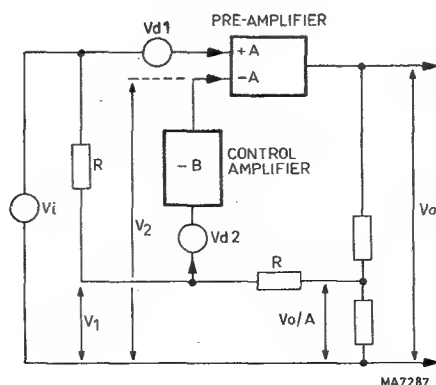

Resistors R131 equalizes the base impedances of transistors TS71 and TS72.

Capacitor C59 limits the feedback at approximately 100 Hz.

Therefore, a variation of the value of potentiometers R64 & R99 causes a variation in the top of a I.f. square-wave voltage. When potentiometers R64 and R99 are correctly adjusted, the pulse top is straight.

#### 3.1.1.6.1. Drift reduction

The drift inherent in the sensitive d.c. coupled pre-amplifier is reduced by feedback via a control amplifier. We shall now calculate the effect of the control amplifier with reference to Fig. 3.2, in which A is the gain factor of the pre-amplifier and B that of the control amplifier. Resistors R are equal.

**Fig. 3.2. Block diagram of the drift-reduction circuit**

We regard the drift voltages from pre-amplifier and control amplifier as being due to d.c. voltage sources at the input ( $V_{d1}$  and  $V_{d2}$ ). We then find:

$$V_1 = \frac{V_i + \frac{V_o}{A}}{2} \quad (1)$$

$$V_2 = -B (V_1 + V_{d2}) \quad (2)$$

$$V_o = A (V_2 - V_i - V_{d1}) \quad (3)$$

It follows from (1) and (3) that:

$$V_1 = \frac{V_i + \frac{A (V_2 - V_i - V_{d1})}{A}}{2} = \frac{V_2 - V_{d1}}{2}$$

Substituting this result in (2) gives:

$$V_2 = -B \left( \frac{V_2 - V_{d1}}{2} + V_{d2} \right) \quad \text{or}$$

$$V_2 \left( 1 + \frac{B}{2} \right) = \frac{B}{2} V_{d1} - B V_{d2} \quad \text{or}$$

$$V_2 = \frac{B V_{d1}}{2 + B} - \frac{B V_{d2}}{1 + \frac{B}{2}}$$

Substituting this result in (3) gives:

$$\frac{V_o}{A} = \left( \frac{B}{2 + B} - 1 \right) V_{d1} - \frac{B V_{d2}}{1 + \frac{B}{2}} - V_i \quad \text{or}$$

$$-\frac{V_o}{A} = V_i + \frac{2}{2 + B} V_{d1} + \frac{B}{1 + \frac{B}{2}} V_{d2} \quad \text{or}$$

$$-\frac{V_o}{A} = V_i + \frac{1}{1 + \frac{B}{2}} V_{d1} + \frac{2}{1 + \frac{2}{B}} V_{d2}$$

The last two terms represent drift voltages which are equivalent to a drift voltage:

$$V_d = \frac{1}{1 + \frac{B}{2}} V_{d1} + \frac{2}{1 + \frac{2}{B}} V_{d2}$$

at the input.

We see that the drift of the pre-amplifiers is reduced by a factor  $(1 + \frac{B}{2})$ . On the other hand, we have an extra drift due to the control amplifier, which is given by  $\frac{2}{1 + \frac{2}{B}} V_{d2} \approx 2V_{d2}$ .

The drift of the control amplifier, however, is so low (because of strong thermal coupling of the amplifier transistors, and optimum design) that the term  $2V_{d2}$  can be neglected.

### 3.1.1.7. Trigger pick-off stage

Transistor TS64 serves a twofold purpose. It acts as an amplifier stage for the channel  $Y_A$  triggering signal further discussed in section 3.1.3.1., and as an emitter-follower for the signal to be tested.

The test signal is applied to the delay line circuit via AMPL. potentiometer R4 in the emitter circuit of transistor TS64. This potentiometer provides an uncalibrated, continuous control of the deflection coefficients.

### 3.1.1.8. Delay line circuit

The delay line circuit consists of an asymmetrically driven differential amplifier (TS902 & TS903), which is coupled with emitter followers (TS901, TS904 & TS906) at the input as well at the output.

Emitter follower TS906 serves the symmetry. From resistor R903 in the emitter circuit of transistor TS901 the signal is, via the delay line, applied to the differential amplifier. The delayed test signal is coupled to the output stage via emitter follower TS904, which reduces the effect of the input capacitance of the output stage on the differential amplifier.

The input of the delay line is terminated by R903//R904 and its output by R907.

### 3.1.1.9. Output amplifier

From the emitter of emitter follower TS904, the signal is applied to the base of transistor TS66 which is part of a differential amplifier. By varying the series feedback of this amplifier by means of potentiometer R111, the overall gain of the  $Y_A$  channel can be set. The RC combination R113-C62 corrects the gain factor at high frequencies.

The Y shift voltage derived from POSITION potentiometer R11 is applied to the base of transistor TS67.

If BEAM SELECTOR switch SK14 is not depressed, the voltage on the base of TS67 is such that the trace is shifted off the screen and cannot be brought back with the POSITION potentiometer.

From the differential amplifier the signal is fed to the final stage which consists of two single-ended push-pull sections, viz. TS57, 58, 59, 68 and TS69, 73, 74, 76. From these two sections, the signal is applied to the Y deflection plates.

The circuit with transistor TS56 will be discussed together with the c.r.t. circuitry (section 3.1.6.3.).

In position X via  $Y_A$ , the signal is fed to the X output amplifier via emitter follower TS75. In this case the channel  $Y_A$  output amplifier is inoperative.

## 3.1.2. CHANNEL $Y_B$ VERTICAL AMPLIFIER

As this channel is identical to channel  $Y_A$  with exception of the circuitry for external X deflection, the description of channel  $Y_A$  also holds good for channel  $Y_B$ . Components are assigned in the 200-299 range (corresponding to numbers in the 1-99 range for channel  $Y_A$ ), in the 300-399 range (corresponding to range 100-199 in channel  $Y_A$ ) and in the 1000-1099 range (corresponding to range 900-999 in channel  $Y_A$ ).

## 3.1.3. TRIGGERING

The trigger unit comprises the following circuits:

a trigger pre-amplifier, a differential amplifier, a sync separator and a trigger-pulse shaper.

The circuit diagram shows all triggering push-buttons in their released positions.

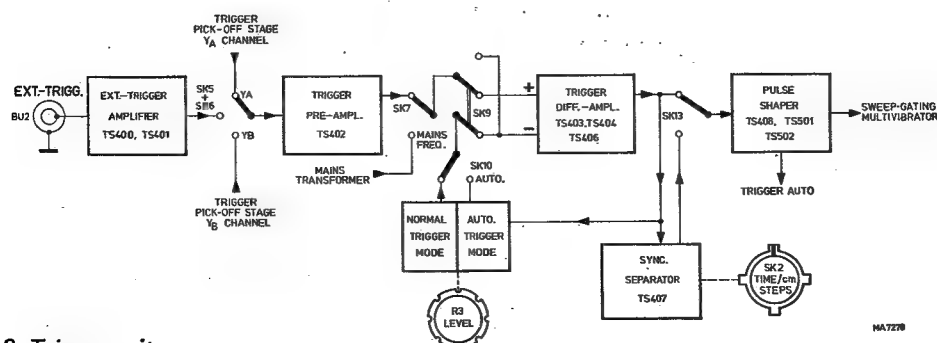

Fig. 3.3. Trigger unit

### 3.1.3.1. Trigger pre-amplifier for internal triggering

If  $Y_A$  push-button SK4 is depressed, trigger pick-off stage TS64 in the  $Y_A$  channel and transistor TS402 form together an amplifier with series and shunt feedback.  $Y_A$  push-button SK4 is only a mechanical release for  $Y_B$  push-button SK5 and is, therefore, not included in the circuit diagram; thus, SK4 depressed corresponds to SK5 released. The gain of trigger pre-amplifier is determined by the ratio of the shunt feedback resistance R412 and the series-feedback resistance in the emitter circuit of transistor TS64.

If  $Y_B$  push-button SK5 is depressed, trigger pick-off stage TS264 in the  $Y_B$  channel and transistor TS402 form the trigger pre-amplifier.

### 3.1.3.2. Trigger pre-amplifier for external triggering

If EXT. push-button SK6 is depressed, transistors TS401 and TS402 form together a similar amplifier with series- and shunt-feedback as described in section 3.1.3.1. Transistor 400 serves as an inverter for the triggering signals so that the next stage is driven in the correct phase. Moreover, this transistor improves the stability of the pre-amplifier. The external trigger input is protected against excessive positive input voltages by means of diodes GR401 and GR402.

### 3.1.3.3. Long-tailed pair circuit (differential amplifier)

The following description applies to internal triggering.

From the pre-amplifier the triggering signal is fed to the long-tailed pair circuit with transistors TS403 and TS404. The signal is applied to the base of transistor TS403 if + push-button SK8 is depressed and to the base of TS404 if – push-button SK9 is depressed.

This allows triggering on either the positive or negative slope of the signal. The + push-button SK8 is a mechanical release for – button SK9 and is, therefore, not included in the circuit diagram.

A d.c. voltage which is variable with LEVEL potentiometer R3' is applied to the base of the non-driven transistor of the long-tailed pair circuit.

As a long-tailed pair circuit amplifies the difference of the base voltages, the setting of potentiometer R3' determines which part of the signal will be amplified and, thus, the trigger level.

The output signal of the long-tailed pair circuit is fed to emitter follower TS406. If AUTO push-button SK10 is depressed, the a.c. component of the emitter signal of TS406 is applied to the full-wave rectifier with diodes GR404 and GR406. The rectified voltage across LEVEL potentiometer R3'' corresponds to the peak-to-peak value of the a.c. component of the triggering signal. This d.c. voltage is fed to the base of transistor TS404 of the long-tailed pair circuit. The result is that in the auto mode the trigger level range corresponds to the peak-to-peak value of the triggering signal.

### 3.1.3.4. Synchronisation separator

If T.V. push-button SK13 is depressed, a synchronisation separator for television is inserted into the triggering signal path. The sync separator comprises transistor TS407. The television signal is clipped in such a way that only the synchronising pulses reach the collector of transistor TS407. In positions .2  $\mu$ s to 20  $\mu$ s (TV LINE) of TIME/cm switch SK2, these pulses are supplied direct to emitter follower TS408.

In positions 50  $\mu$ s to .5 s (TV FRAME) the composite synchronising signal is integrated by means of R439, C412, GR407, R442 and C413 at such a time constant that the frame pulses are separated. The separated pulses are applied to emitter follower TS408.

### 3.1.3.5. Trigger-pulse shaper

The trigger-pulse shaper comprises transistors TS501 & TS502 in Schmitt-trigger configuration. With a repetitive trigger signal, a square-wave voltage of constant amplitude and width arises at the collector of TS502. This square-wave voltage is differentiated by C502 and R514 into narrow positive and negative pulses. The positive pulses are short-circuited by GR501 so that sweep-gating multivibrator TS503-TS504 receives only negative pulses.

### 3.1.4. TIME-BASE GENERATOR

The time-base generator comprises a sweep-gating multivibrator, a sawtooth generator, a hold-off circuit and an auto circuit.

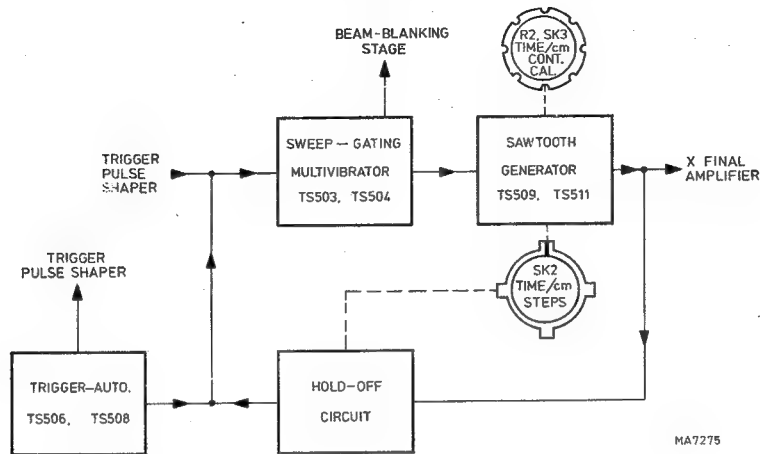

Fig. 3.4. Time-base generator

#### 3.1.4.1. Sweep-gating multivibrator and sawtooth generator

The sweep-gating multivibrator comprises transistors TS503 and TS504 in Schmitt-trigger configuration. In the state transistor TS503 cut off and transistor TS504 conducting, transistor TS509 is cut off.

Then the time-base capacitor selected with TIME/cm switch SK2 is charged with a constant current supplied by transistor TS511. The rate of voltage increases which determines the sweep time or time coefficient, is inversely proportional to the capacitance of the selected capacitor and direct proportional to the current through transistor TS511. This current is determined by the base voltage of transistor TS511, the voltage of which can be set by the TIME/cm vernier control R2 and preset by potentiometers R534 and R539.

The charging current is, moreover, determined by the value of the emitter resistors of transistor TS511, which are also switched over by TIME/cm switch SK2.

The sawtooth voltage is taken off by a cascade circuit consisting of emitter followers TS512 and TS513 and applied to both the hold-off circuit and the horizontal amplifier.

Via the hold-off circuit, the sawtooth voltage is fed back to the input of the sweep-gating multivibrator whose input level is preset with stability potentiometer R553. At a certain value of the sawtooth voltage, in the automatic mode, the sweep-gating multivibrator is set to the state transistor TS503 conducting and transistor TS504 cut off. In the other trigger modes the switching over occurs when the sum of sawtooth voltage and trigger pulses reaches a certain value. Then transistor TS509 starts conducting and the time-base capacitor is discharged via this transistor. This cycle is repeated upon arrival of the next trigger pulse.

#### 3.1.4.2. Hold-off circuit

Due to the effect of diode GR504, the charge of the hold-off capacitor selected with TIME/cm switch SK2, cannot follow the decay of the sawtooth voltage.

The capacitor voltage will then decrease with an RC time which is sufficiently large to allow the sawtooth to reach its zero level and to ensure the decay of the switching phenomena. During this RC time, the input level of the sweep-gating multivibrator is so high that incoming trigger pulses have no effect.

#### 3.1.4.3. Auto circuit

The AUTO circuit makes the time-base generator free-running when there are no trigger pulses.

The AUTO circuit works in every trigger mode, except when either AC push-button SK11 or DC push-button SK12 is depressed.

If there are trigger pulses, they are fed to the base of transistor TS506 of the AUTO circuit. As a result of this, the two transistors TS506 and TS508 of the AUTO circuit are conductive until capacitor C506 is discharged. The voltage at the cathode of diode GR502 is then so positive that the latter remains blocked and the working of the sawtooth generator, as described above, is not affected.

As soon as there are no trigger pulses, capacitor C506 will be charged and diode GR502 becomes conductive. The voltage level at the input of the sweep-gating multivibrator TS503-TS504 then drops to such a value that the multivibrator switches over and a sawtooth is formed. This occurs immediately after the drop of the hold-off pulse, i.e., the time-generator is free-running.

### 3.1.5. HORIZONTAL AMPLIFIER

In the time positions of TIME/cm switch SK2 the sawtooth voltage of the time-base generator is fed to the base of transistor TS603. The sawtooth is also applied, for external purposes, to TB OUT socket BU6 via emitter follower TS516.

Fig. 3.5. Horizontal amplifier

In position X via  $Y_A$  of TIME/cm switch SK2, the external X deflection voltage applied to the  $Y_A$  channel is fed from transistor TS64 to the base of transistor TS603, via emitter follower TS75 and amplifier TS602. The external X deflection voltage is also applied to TB OUT socket BU6, via emitter follower TS516.

The horizontal output amplifier comprises two stages.

The first one with transistors TS603 and TS604 is provided with series-feedback.

The second one consists of two single-ended push-pull sections TS607-608 and TS609-611 with shunt-feedback. From the latter stage the deflection signal is fed to the c.r.t.

The gain of the output amplifier is determined by the shunt-feedback resistors R628 and R633, and the emitter resistance of transistors TS603 and TS604.

X MAGN switch SK1 allows a gain control in two steps.

If switch SK1 is closed (X MAGN knob pulled out), the series-feedback in the emitter circuit of transistors TS603 and TS604 is decreased in such a way that the gain of the output amplifier is increased by a factor of 5. In the latter mode, the magnified mode, the gain can be preset by means of potentiometer R617 and in the normal mode by means of potentiometer R618.

In position X via  $Y_A$  of TIME/cm switch SK2, switch SK1 is bypassed and the output amplifier works in the magnified mode.

The horizontal shift voltage coming from X POSITION potentiometer R1 is supplied to the base of transistor TS604. Transistor TS606 acts as a constant emitter-current source for amplifier stage TS603-TS604.

### 3.1.6. CATHODE-RAY TUBE CIRCUITRY

#### 3.1.6.1. General information

The c.r.t. circuitry provides control for brightness, focus and astigmatism, and correction possibilities for barrel and pin-cushion distortion and the position of the trace. The blanking circuit is also part of the c.r.t. circuitry.

Fig. 3.6. Cathode-ray tube circuitry

#### 3.1.6.2. C.r.t. circuit

By means of INTENS potentiometer R10 the brightness of the display can be continuously controlled.

The maximum beam current is set by potentiometer R801.

The control range of the INTENS potentiometer can be preset by means of potentiometer R802.

A brightness modulation facility, a.c. coupled, is provided on Z MOD input socket BU7.

The display can be focused by means of FOCUS potentiometer R9. In a split-beam c.r.t. as used in this oscilloscope, focusing has certain consequences.

These consequences and their remedies are discussed in section 3.1.6.3.

Astigmatism is corrected on a low-impedance level by means of potentiometer R809 via emitter follower TS801.

With the aid of potentiometer R812 barrel and pin-cushion distortion is corrected.

Potentiometer R813 provides trace rotation control and allows the time-base line to be accurately aligned with the horizontal graticule lines.

#### 3.1.6.3. Focusing in the split-beam c.r.t.

In the split-beam c.r.t. the electron beam is split into two parts which form the traces of the  $Y_A$  and  $Y_B$  channel.

Both traces are controlled independently by the controls of both channels. The electron beam is focused, however, before it is split and, therefore, there is only one focus control. This mono-knob control of the focus has the following consequence.

Assume a focus setting as illustrated in Fig. 3.7.1.

Then the focusing point is exactly on the screen.

When the FOCUS potentiometer R9 is rotated, the focusing point is displaced to a point either side of the screen (Figs. 3.7.2. & 3.7.3.) This results in both traces moving away from each other. The more clockwise or anti-clockwise the FOCUS control is turned, the further the traces move apart.

MA 7288

Fig. 3.7. Effect of the focus control

To compensate for this trace shift, an extra shift voltage is fed to the vertical amplifier channels via transistor TS56. The magnitude of this voltage is controlled by potentiometer R9' which is part of FOCUS tandem potentiometer R9. The control is such, that the displacement caused by operation of the FOCUS control is compensated for.

The compensation voltage for channel  $Y_A$  is obtained from the emitter of transistor TS56 and that for channel  $Y_B$  from the collector.

The compensation is so effective that the maximum displacement of each trace, caused by rotating FOCUS potentiometer R9 from fully anti-clockwise to fully clockwise, does not exceed 2 mm.

#### 3.1.6.4. Blanking circuit

The blanking circuit blanks the c.r.t. during the fly-back of the time-base and unblanks the c.r.t. during the sweep and constantly if TIME/cm switch SK2 occupies position X via  $Y_A$ .

The blanking circuit operates on a low voltage level and comprises an a.c. and a d.c. path.

Transistor TS706 is driven by the collector signal of transistor TS504 in the sweep-gating multivibrator.

Transistor TS706 forms together with transistor TS704 a single-ended push-pull circuit.

- **A.C. Path:** The amplified a.c. components of the blanking signal are fed direct to the Wehnelt cylinder of the c.r.t. via H.T. capacitor C707.
- **D.C. Path:** For the d.c. component of the blanking signal, the signal of oscillator TS702 & TS703 is used. The oscillator signal is modulated with the blanking signal. The amplified modulated signal on the collector of transistor TS703 is via capacitor C706 fed to demodulator GR702-R713. After demodulation, also the d.c. component of the blanking signal is available.

The a.c. and d.c. amplifications are equalized by means of potentiometer R711.

#### 3.1.7. CALIBRATION VOLTAGE

The calibration voltage generator consists of free-running multivibrator TS750 & TS751. The generator frequency is approximately 2 kHz. The amplitude of the generated square-wave voltage is kept at a constant value by means of zener diode GR751. The exact value of the calibration is set with the aid of potentiometer R761.

### 3.1.8. POWER SUPPLY

The power supply comprises the mains transformer, stabilized supply and converter, and the circuit for the graticule illumination.

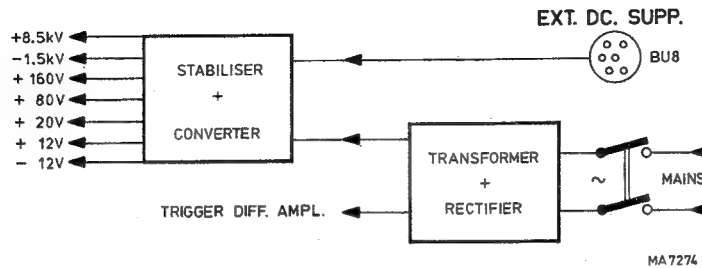

Fig. 3.8. Power supply

#### 3.1.8.1. Mains transformer

Mains transformer TS801 has three primary windings (S1, S1' and S1'') which, together with the secondary winding (S2//S3), can be combined by means of voltage adapter SK21. This combination allows the instrument to be used with mains voltages of 110 V, 127 V, 220 V and 240 V.

The voltage on secondary winding is full-wave rectified. The resulting negative d.c. voltage, or alternatively a negative d.c. voltage on EXT DC SUPPLY input socket BU8, is applied to the voltage stabilizer and converter.

Part of the a.c. voltage on secondary winding of the mains transformer is fed to MAINS trigger source switch SK7, to enable internal triggering on the mains frequency.

#### 3.1.8.2. Converter and stabilized power supply

The converter is a regenerative square-wave generator operating at a frequency of approx. 18 kHz. A basic diagram of the converter is shown in Fig. 3.9.

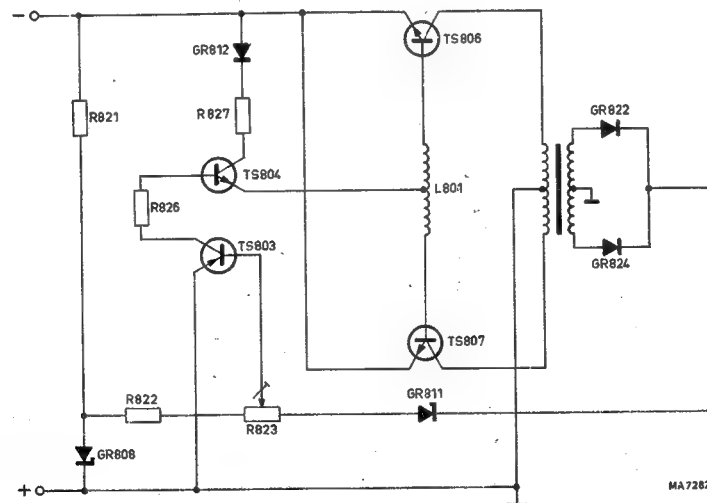

Fig. 3.9. Basic diagram of the converter

In the converter, transistors TS806 and TS807 function as switches and regulators and alternately connect the negative supply voltage to either end of the primary of L801/802. Assume that transistor TS806 has a slightly higher current gain than TS807. Then the positive voltage from the feedback winding quickly drives transistor TS806 into saturation. The current in the top half of the primary of L801/802 increases linearly at a rate determined by the inductance in the primary. This current increase continues until the iron in transformer coil L801 is saturated.

Then the magnetic lines of flux stop changing and consequently no voltage is induced any longer in the feedback winding. When its base drive ceases, transistor is cut off. This reverses the polarity of the feedback voltage and transistor TS807 is turned hard on. The bottom half of the primary then passes an increasing current until the core is saturated in the opposite direction. The subsequent absence of feedback voltage initiates the switching back to TS806 and the cycle starts again.

The regulation works as follows. When an input voltage is applied to the converter, the negative voltage across Zener diode GR808 turns transistor TS803 fully on, as there is no positive voltage from Zener diode GR811.

Then a bias current starts flowing from earth via transistor TS803 through resistor R826, through the base-emitter junction of transistor TS804 (operating as a diode since diode GR812 interrupts the collector circuit) and from base to emitter of both transistors TS806 and TS807.

As there is then an a.c. voltage across the secondary of L801/802, diodes GR822 and GR824 produce a positive d.c. voltage. This voltage reduces the current through transistors TS803 and TS804 sufficiently to limit the drive to transistors TS806 and TS807 and produce the desired output level. The setting of potentiometer R823 determines the value of the regulated output voltage. Possible differences from the set output voltage are fed back via Zener diode GR811 to transistor TS803 so that the drive of transistors TS806 and TS807 is adapted so as to compensate for the differences. This also applies to mains voltage fluctuations.

After rectifying, the secondary voltages +12 V (reference), -12 V, +20 V, +80 V, +160 V, -1500 V and high voltage +8500 V are obtained. The voltage quintupler which supplies the +8500 V cannot be repaired and must be replaced when it breaks down.

All supply voltage except the +8500 V and the -1500 V can be continuously short-circuited without damage to the components. Resistor R827 limits the maximum base current drive to transistors TS806 and TS807 and thus the maximum power output which can be drawn from the converter.

Resistor R826 limits the collector current when the output is short-circuited and the switching action is stopped, thereby holding the dissipated power in transistors TS806 and TS806 at a safe level. Thus, the power supply of the oscilloscope is fully protected against short-circuits. A short-circuit is indicated either by a squeaking noise coming from the power supply or by the pilot lamp failing to light up.

### 3.1.8.3. Illumination circuit

The graticule of the c.r.t. can be illuminated by means of bulbs LA1 and LA2. The intensity can be varied with the aid of ILLUM potentiometer R8 which controls the collector current (which is the current through the bulbs) of transistor TS802. The illumination circuit is not short-circuit proof.

## 3.2. Checking and adjusting

### 3.2.1. GENERAL INFORMATION

All adjusting elements have been listed in the heading of the various sections.

The tolerances mentioned in the following text apply to newly adjusted instruments only. The values may differ from those given in chapter 1.2. CHARACTERISTICS.

### 3.2.2. POWER SUPPLY

#### 3.2.2.1. Mains current

- Check that the mains voltage adapter (SK21) has been set to 220 V and connect the instrument to such a voltage (frequency 50 Hz)
- Switch the oscilloscope on and check that the pilot lamp lights up
- Check that the current consumption does not exceed 200 mA (measured with a moving-iron meter)

#### 3.2.2.2 Supply voltages (R823)

- Check that the voltage across capacitor C833 is +12 V, + or –20mV; if necessary, readjust potentiometer R823 (Fig. 3.10).
- Check the supply voltages in accordance with the following table:

Voltage across	Required value	Max. allowable ripple
C833 (Fig. 3.10)	+ 12 V, $\pm$ 30 mV	4 mV <sub>p-p</sub>
C836 (Fig. 3.10)	– 12 V, $\pm$ 400 mV	6 mV <sub>p-p</sub>
C831 (Fig. 3.10)	+ 20 V, $\pm$ 900 mV	40 mV <sub>p-p</sub>
C829 (Fig. 3.10)	+ 80 V, $\pm$ 2 V	250 mV <sub>p-p</sub>
C828 (Fig. 3.10)	+160 V, $\pm$ 3 V	100 mV <sub>p-p</sub>

Fig. 3.10. Adjusting and dismantling

- Vary the a.c. voltage to which the instrument is connected between 198 V and 242 V
- Check that the supply voltages do not vary more than 0.5 % and that the ripple voltages do not exceed the values mentioned in the table above.

### 3.2.3. CATHODE-RAY CIRCUIT

#### 3.2.3.1. Adjustment to display time-base lines

1500 V Use a well-insulated screw-driver to protect both yourself and the circuitry.

##### 3.2.3.1.1. Time-base (R801, R802, R553)

- Turn potentiometers R801 and R802 (Fig. 3.11.) clockwise and potentiometer R553 (Fig. 3.12.) anti-clockwise
- Turn INTENS potentiometer R10 clockwise
- Set X POSITION potentiometer R1 to its mid-position and depress MAGN switch SK1
- Set the POSITION potentiometers R11 and R12 to their mid-positions
- Set TIME/cm switch SK2 to 1 ms
- Depress BEAM SELECTOR switches A SK14 and B SK15
- Set AMPL switches SK17 and SK18 to .1V/cm; there should be a display of two time-base lines
- See for adjusting with components R801 and R802 point 3.2.3.6.

##### 3.2.3.1.2. Time-base stability (R553)

- Depress  $Y_A$  switch SK4, + switch SK8, AC switch SK11 and BEAM SELECTOR switch A SK14
- Turn potentiometer R553 (Fig. 3.12.) clockwise until the time-base line disappears
- Depress AUTO switch SK10. A time-base line must become visible. If necessary, readjust potentiometer R553.

##### 3.2.3.2. Trace rotation (R813)

- Depress AUTO switch SK10 and BEAM SELECTOR switch A SK14
- Set AC-0-DC switch SK16 to 0
- Centre the time-base line by means of POSITION potentiometer R11
- Check that the time-base line runs exactly in parallel with the horizontal lines of the graticule. If necessary, readjust trace rotation potentiometer R813 (Fig. 3.11.)

##### 3.2.3.3. Beam correction

- Depress AUTO switch SK10 and BEAM SELECTOR switches A SK 14 and B SK 15
- Set AC-0-DC switches SK 16 and SK 19 to 0
- Position the traces symmetrically around the centre of the screen using POSITION potentiometer R11 and R12
- Adjust INTENS potentiometer R10 for a low brightness
- Check that both traces are equally bright Magnets 1 and 2 adjusted in the factory to the same brightness. Magnet 2 can be readjusted by means of a screwdriver through an opening in the bottomplate of the oscilloscope.

##### 3.2.3.4. Focus and astigmatism (R809, R804)

- Depress AUTO switch SK10 and BEAM SELECTOR switches A SK14 and B SK15
- Set TIME/cm switch SK2 to .2 ms and TIME/cm potentiometer to CAL
- Set AMPL switches SK17 and SK18 to .1 V and AMPL potentiometers R4 and R5 to CAL
- Set INTENS potentiometer R10 for normal brightness
- Set AC-0-DC switches SK16 and SK19 to DC
- Apply a sine-wave signal of 400 mV<sub>p-p</sub>, 2 kHz, to  $Y_A$  input socket BU3 and  $Y_B$  input socket BU5

Use an insulated screw-driver

- Adjust FOCUS potentiometer R9 and astigmatism potentiometer R809 (Fig. 3.11.) for sharp, well-defined traces. Find the setting that gives the best result for both channels
- Set FOCUS potentiometer R9 in mid-stroke position and check for sharp traces. If necessary select a different value for R804.

### 3.2.3.5. Barrel & pin cushion distortion (R812)

- Set TIME/cm switch SK2 to 1 ms and TIME/cm potentiometer R2 to CAL
- Set AMPL switch SK17 to 10 mV/cm and AMPL potentiometer R4 to CAL
- Depress BEAM SELECTOR switch A SK14
- Set AC-0-DC switch SK16 to DC
- Apply a sine-wave signal of 1 V<sub>p-p</sub>, 2 kHz, to Y<sub>A</sub> input socket BU3

Use an insulated screw-driver. Be careful not to make any short-circuits.

- Check that the displayed vertical lines are straight.  
If necessary, readjust potentiometer R812 (Fig. 3.11.)

### 3.2.3.6. Brightness (R711, R801, R802)

1500 V Use a well-insulated screw-driver to protect both yourself and the circuitry.

- Switch the instrument on at least 15 minutes before starting this check
- Depress Y<sub>A</sub> switch SK4, + switch SK8, AUTO switch and BEAM SELECTOR switch A SK14
- Set AC-0-DC switch SK16 to 0
- Set AMPL switch SK17 to .1 V/cm
- Set INTENS potentiometer R10 for low brightness
- Set TIME/cm switch SK2 to 1 ms and TIME/cm potentiometer R2 to CAL
- Check that the time-base line shows a constant brightness over the entire length; if necessary, readjust potentiometer R711 (Fig. 3.12.)
- Check that the brightness remains constant in all other positions of TIME/cm switch SK2
- Depress AC switch SK11
- Set TIME/cm switch SK2 to 1 ms
- Turn INTENS potentiometer R10 fully clockwise
- The spot must just be visible; if necessary, readjust potentiometer R801 (Fig. 3.11.)
- Depress AUTO switch SK10
- Set INTENS potentiometer R10 to 90° from its left-hand stop
- Check that the time-base line is barely visible; if necessary, readjust potentiometer R802 (Fig. 3.11.)

### 3.2.3.7. Focus correction

- Depress AUTO switch SK10 and BEAM SELECTOR switches A SK14 and B SK15
- Set AC-0-Dc switches SK16 and SK19 to 0
- Set AMPL switches SK17 and SK18 to .1 V/cm and AMPL potentiometers R4 and R5 to CAL
- Shift the time-base lines on to the horizontal central graticule line with the aid of POSITION potentiometers R11 and R12
- Rotate FOCUS potentiometer R9 from fully anti-clockwise to fully clockwise and check that this does not cause the time-base lines to shift more than 2 mm

## 3.2.4. VERTICAL AMPLIFIERS

### 3.2.4.1. General information

The adjustments of the vertical amplifier channels Y<sub>A</sub> and Y<sub>B</sub> are identical. The knobs, sockets and adjusting elements of channel Y<sub>B</sub> are shown in brackets after those of channel Y<sub>A</sub>.

#### 3.2.4.2. D.C. Balance (R6, R7)

- Depress  $Y_A$  ( $Y_B$ ) switch SK4 (SK5), + switch SK8 and BEAM SELECTOR switch A SK14 (B SK15)
- Set AC-0-DC switch SK16 (SK19) to 0
- Set AMPL potentiometer R4 (R5) to CAL
- Check that the trace does not shift if AMPL switch SK17 (SK18) is switched from .1 V/cm to 2 mV/cm. If necessary, readjust DC BAK R6 (R7). During the adjustment, the trace must be kept in the centre of the screen by means of POSITION potentiometer R11 (R12)
- Check that the position of the trace is the same in positions 2, 5, 10, 50 and 100 mV/cm of AMPL switch SK17 (SK18); the maximum allowable difference 4 mm

#### 3.2.4.3. Gate current (R126, R326)

- Depress  $Y_A$  ( $Y_B$ ) switch SK4 (SK5), BEAM SELECTOR switch A SK14 (B SK15) and + switch SK8
- Set AMPL switch SK17 (SK18) to 2 mV/cm
- Check that the trace does not jump when AC-0-DC switch SK16 (SK19) is switched from 0 to DC; if necessary, readjust potentiometer R126 (R326); Fig. 3.13. tolerance at final check 4 mm.

#### 3.2.4.4. Pre-amplifier (R64, R99, R264, R299)

- Depress  $Y_A$  ( $Y_B$ ) switch SK4 (SK5), AUTO switch SK10 and BEAM SELECTOR switch A SK14 (B SK15)
- Set TIME/cm switch SK2 to 10 ms and TIME/cm potentiometer R2 to CAL
- Set AC-0-DC switch SK16 (SK19) to DC
- Set AMPL switch SK17 (SK18) to .1 V/cm and AMPL potentiometer R4 (R5) to CAL
- Apply a square-wave voltage of 600 mV<sub>p-p</sub>, 100 Hz, to  $Y_A$  ( $Y_B$ ) input socket BU3 (BU5)
- Check that the pulse top is straight; if necessary, readjust potentiometer R99 (R299), Fig. 3.13.
- Set AMPL switch SK17 (SK18) to 2 mV/cm
- Decrease the input voltage to 12 mV<sub>p-p</sub>
- Check that the pulse top is straight; if necessary, readjust potentiometer R64 (R264), Fig. 3.14
- Check that in the ranges 50, 20, 10 and 5 mV/cm of AMPL switch SK17 (SK18) the top is straight; tolerance 1 %

#### 3.2.4.5. Sensitivity (R111, R311)

- Depress  $Y_A$  ( $Y_B$ ) switch SK4 (SK5), AUTO switch SK10, + switch SK8 and BEAM SELECTOR switch A SK14 (B SK15)
- Set TIME/cm switch SK2 to 2 ms and TIME/cm potentiometer R2 to CAL
- Set AC-0-DC switch SK16 (SK19) to DC
- Set AMPL switch SK17 (SK18) to .1 V/cm and AMPL potentiometer R4 (R5) to CAL
- Apply a voltage of exactly 600 mV<sub>p-p</sub>, 2 kHz, to  $Y_A$  ( $Y_B$ ) input socket BU3 (BU5)
- Check that the trace height is exactly 6 cm; if necessary, readjust potentiometer R111 (R311), Fig. 3.13.
- Check that the control range of AMPL potentiometer R4 (R5) is 1:2,6 to 1:4

#### 3.2.4.6. Input attenuator (C28, C29, C33, C34, C52, C228, C229, C233, C234, C235, C252)

- Depress  $Y_A$  ( $Y_B$ ) switch SK4 (SK5), AUTO switch SK10, + switch SK8 and BEAM SELECTOR switch A SK14 (B SK15)
- Set TIME/cm switch SK2 to 50  $\mu$ s and TIME/cm potentiometer R2 to CAL
- Set AC-0-DC switch SK16 (SK19) to DC
- Connect a square-wave voltage with an amplitude as indicated in the following table, a repetition rate of 10 kHz and a rise time not exceeding 200 ns to  $Y_A$  ( $Y_B$ ) input socket BU3 (BU5).

- Check that no overshoot is visible (maximum pulse top errors 2 %) and also check the trace height; if necessary, correct the pulse top errors with the aid of the trimmers (Fig. 3.14.) mentioned in the following table;

Position AMPL switch SK17 (18)	Signal to $Y_A$ ( $Y_B$ ) BU3 (5)	Adjust with	Trace height
2 mV/cm	12 mV	C52 (C252)	6 cm + or –2 %
5 mV/cm	30 mV	C52 (C252)	6 cm + or –2 %
10 mV/cm	60 mV	C52 (C252)	6 cm + or –2 %
20 mV/cm	120 mV	C52 (C252)	6 cm + or –2 %
50 mV/cm	300 mV	C52 (C252)	6 cm + or –2 %
.1 V/cm	600 mV	C52 (C252)	6 cm + or –2 %
.2 V/cm	1.2 V	C28 (C228)	6 cm + or –2 %
.5 V/cm	3 V	C28 (C228)	6 cm + or –2 %
1 V/cm	6 V	C28 (C228)	6 cm + or –2 %
2 V/cm	12 V	C33 (C233)	6 cm + or –2 %
5 V/cm	30 V	C33 (C233)	6 cm + or –2 %
10 V/cm	60 V	C33 (C233)	6 cm + or –2 %

- Set AMPL switches SK17 and SK18 to .1 V/cm
- Apply a square-wave voltage of  $1.2 V_{p-p}$ , repetition rate 10 kHz, rise time not exceeding 200 ns, to  $Y_A$ , input socket BU3 via a 2:1 dummy measuring probe consisting of a 1 MOhm resistor and a 30 pF trimmer in parallel. If higher voltages are available, a 10:1 attenuator probe may be used.
- Adjust the trimmer of the dummy probe for optimum square-wave response
- Apply the input signal via the dummy probe to  $Y_B$  input socket BU5
- Check that the top of the displayed pulse is straight; if necessary, readjust trimmer C235 (Fig. 3.14)
- Connect, via the dummy probe, a square-wave voltage with an amplitude as indicated in the following table, a repetition rate of 10 kHz and a rise time not exceeding 200 ns to  $Y_A$  ( $Y_B$ ) input socket BU3 (BU5)
- Check that neither overshoot nor rounding is visible (maximum pulse top errors 3%) add also check the trace height; if necessary, correct the pulse top errors with the aid of the trimmers (Fig. 3.14.) mentioned in the following table

Position AMPL switch SK17 (18)	Signal to 2:1 dummy	Adjust with	Trace height
.2 V/cm	2.4 V	C29 (C229)	6cm + or –2 %
.5 V/cm	6 V	C29 (C229)	6 cm + or –2 %
1 V/cm	12 V	C29 (C229)	6 cm + or –2 %
2 V/cm	24 V	C34 (C234)	6 cm + or –2 %
5 V/cm	60 V	C34 (C234)	6 cm + or –2 %
10 V/cm	60 V	C34 (C234)	3 cm + or –3 %

### 3.2.4.7. Square-wave response (C901, C1001, C902, C1002, C62, C262, R113, R313)

- Depress  $Y_A$  ( $Y_B$ ) switch SK4 (SK5), AUTO switch SK10 and BEAM SELECTOR switch A SK14 (B SK15)
- Set TIME/cm switch SK2 to .2  $\mu$ s and TIME/cm potentiometer R2 to CAL
- Set AMPL switch SK17 (SK18) to .1 V/cm and AMPL potentiometer R4 (R5) to CAL
- Set AC-0-DC switch SK16 (SK19) to AC
- Apply a square-wave voltage of 600 mV, repetition rate 1 MHz, rise time 1 ns
- Check the square-wave response. The pulse top errors must not exceed 3 %, maximum permissible overshoot is 2 %; if necessary, readjust trimmers C901 (C1001), C902 (C1002) and C62 (C262) or select a different value for resistor R113 (R313)
- Set AMPL switch SK17 (SK18) to 0.2 mV/cm
- Decrease the input voltage to 12 mV
- Check that the pulse top errors do not exceed 3 % and the overshoot more than 2 %.

### 3.2.4.8. Bandwidth of the vertical amplifiers

- Depress  $Y_A$  ( $Y_B$ ) switch SK4 (SK5), AUTO switch SK10 and BEAM SELECTOR switch A SK14 (B SK15)
- Set AMPL switch SK17 (SK18) to .1 V/cm and AMPL potentiometer R4 (R5) to CAL
- Check the bandwidth at a trace height of 6 cm in accordance with the following table

<i>Input sine wave on <math>Y_A</math> (<math>Y_B</math>) socket</i>	<i>Frequency</i>	<i>Required trace height</i>
600 mV <sub>p-p</sub>	100 kHz	6 cm
600 mV <sub>p-p</sub>	10 MHz	at least 4,2 cm

### 3.2.4.9. H.F. deflection and cross-talk

- Depress  $Y_A$  ( $Y_B$ ) switch SK4 (SK5), AUTO switch SK10 and BEAM SELECTOR switches SK14 and SK15
- Set AMPL switch SK17 (SK18) to 50 mV/cm and AMPL potentiometer R4 (R5) to CAL
- Apply a sine-wave voltage of 1,2 V<sub>p-p</sub>, frequency 3 MHz, to  $Y_A$  ( $Y_B$ ) input socket BU3 (BU5)
- Check that the peaks of the signal can be displayed fairly undistortedly within the graticule, using POSITION potentiometer R11 (R12)
- Set AMPL switches SK17 & SK18 to .1 V/cm and AMPL potentiometers R4 & R5 to CAL
- Apply a sine-wave signal 1,2 V, frequency 3 MHz, to  $Y_A$  input socket BU3
- Set AC-0-DC switch SK19 to 0
- Check that the height of the  $Y_B$  trace does not exceed 2 mm
- Set AMPL switches SK17 & SK18 to 50 mV/cm and AMPL potentiometers R4 & R5 to CAL
- Apply the input signal to  $Y_B$  input socket BU5
- Set AC-0-DC switch SK16 to 0
- Check that the height of the  $Y_A$  trace does not exceed 2 mm

## 3.2.5. TRIGGERING

### 3.2.5.1. Trigger pre-amplifier (R414)

- Depress  $Y_A$  switch SK4, + switch SK8, AC switch SK11 and BEAM SELECTOR switch A SK14
- Set AMPL switch SK17 to .1 V/cm and AMPL potentiometer R4 to CAL
- Set AC-0-DC switch SK16 to AC
- Set TIME/cm switch SK2 to .2 ms and TIME/cm potentiometer R2 to CAL
- Apply a sine-wave signal of 600 mV<sub>p-p</sub>, frequency 2 kHz, to  $Y_A$  input socket BU3
- Set LEVEL potentiometer R3 to such a position that the trace starts at the zero level of the sine-wave
- Depress DC switch SK12
- Check that the trace starts at the same point; if necessary, readjust potentiometer R414 (Fig. 3.12.)
- Decrease the input voltage to 80 mV
- Adjust LEVEL potentiometer R3 for a triggered display
- Check that the display is still triggered when AC switch SK11 is depressed.
- Depress BEAM SELECTOR switch B SK15,  $Y_B$  switch SK5 and DC switch SK12
- Apply the 80 mV input signal to  $Y_B$  socket BU5
- Set AMPL switch SK18 to .1 V/cm and AMPL potentiometer R5 to CAL
- Adjust LEVEL potentiometer R3 for a triggered display
- Depress AC switch SK11; the starting point of the trace must not move more than 4 mm.

### 3.2.5.2. Long-tailed pair circuit (R424)

- Depress  $Y_A$  switch SK4, – switch SK9, AUTO switch SK10 and BEAM SELECTOR switch A SK14
- Set AMPL switch SK17 to .1 V/cm and AMPL potentiometer R4 to CAL
- Set TIME/cm switch SK2 to .2 ms and TIME/cm potentiometer R2 to CAL
- Set AC-0-DC switch SK16 to AC
- Apply a sine-wave voltage of 80 mV<sub>p-p</sub>, frequency 2 kHz, to  $Y_A$  socket BU3
- Check that the display remains stationary when LEVEL potentiometer R3 is rotated from fully anti-clockwise to fully clockwise; if necessary readjust potentiometer R424 (Fig. 3.12.)

**3.2.5.3. Trigger slope**

- Depress  $Y_A$  switch SK4, AUTO switch SK10, + switch SK8 and BEAM SELECTOR switch A SK14
- Set TIME/cm switch SK2 to .2 ms and TIME/cm potentiometer R2 to CAL
- Set AMPL switch SK17 to .1 V/cm and AMPL potentiometer R4 to CAL
- Apply a sine-wave signal of 600 mV<sub>p-p</sub>, frequency 2 kHz, to  $Y_A$  input socket BU3
- Adjust LEVEL potentiometer R3 for a stationary display
- Check that the display starts with the positive slope of the signal
- Depress — switch SK9
- Check that the display starts with the negative slope of the signal

**3.2.5.4. Level range with external triggering**

- Depress EXT switch SK6, AC switch SK11, + switch SK8 and BEAM SELECTOR switch A SK14
- Set AMPL switch SK17 to 10 V/cm and AMPL potentiometer R4 to CAL
- Set TIME/cm switch SK2 to .2 ms and TIME/cm potentiometer R2 to CAL
- Apply a sine-wave voltage of 20 V<sub>p-p</sub>, frequency 2 kHz, to both TRIGG input socket BU2 and  $Y_A$  input socket BU3
- Check that the time-base generator cuts out when LEVEL potentiometer R3 is turned fully anti-clockwise and fully clockwise
- Depress — switch SK9 and repeat the check

**3.2.5.5. Level and level range**

- Depress  $Y_A$  switch SK4, AUTO switch SK10, + switch SK8 and BEAM SELECTOR switch A SK14
- Set AMPL switch SK17 to .1 V/cm and AMPL potentiometer R4 to CAL
- Set TIME/cm switch SK2 to .2 ms and TIME/cm potentiometer R2 to CAL
- Apply a sine-wave voltage of 600 mV<sub>p-p</sub>, frequency 2 kHz, to  $Y_A$  input socket BU3
- Check that the starting point of the trace moves upwards when LEVEL potentiometer R3 is turned clockwise
- Check that the starting point of the trace can be shifted over 5 cm by means of LEVEL potentiometer R3
- Depress AC switch SK11
- Set AMPL switch SK17 to 50 mV/cm
- Check that the time-base generator cuts out when LEVEL potentiometer R3 is turned fully anti-clockwise and fully clockwise
- Check AMPL SK17 switch to 20 mV/cm
- Check that the time-base generator does not cut out when LEVEL potentiometer R3 is turned fully anti-clockwise and fully clockwise.

**3.2.5.6. Mains triggering**

- Depress EXT switch SK6, + switch SK8, AUTO switch SK10 and BEAM SELECTOR switch A SK14
- Set TIME/cm switch SK2 to 20 ms and TIME/cm potentiometer R2 to CAL
- Apply a voltage with the mains frequency to  $Y_A$  input socket BU3; trace height 1 cm
- Check that the oscilloscope displays a moving sine wave
- Depress MAINS switch SK7
- Check that the display is stationary

**3.2.5.7. Trigger sensitivity**

- Set AC-0-DC switches SK16 and SK19 to DC
- Set LEVEL potentiometer R3 to obtain a stationary display
- Set TIME/cm switch SK2 so that a reasonable number of cycles is displayed
- Check the trigger sensitivity in accordance with the following table

<i>Input signal to</i>	<i>Frequency (sine wave)</i>	<i>Depress source switch</i>	<i>Depress mode switch</i>	<i>Depress BEAM SELECTOR</i>	<i>Triggering at</i>
Y <sub>A</sub> BU3	20 Hz	Y <sub>A</sub> SK4	AUTO SK10	A SK14	8 mm
	10 MHz				8 mm
	20 Hz		AC SK11		8 mm
	10 Hz				8 mm
	5 Hz		DC SK12		8 mm
	10 MHz				8 mm
Y <sub>B</sub> BU5	20 Hz	Y <sub>B</sub> SK5	AUTO SK10	B SK15	8 mm
	10 MHz				8 mm
TRIGG BU2 & Y <sub>B</sub> BU5	20 Hz	EXT SK6		B SK15	0.8 V
	10 MHz				0.8 V

### 3.2.5.8. TV Triggering

- Depress Y<sub>A</sub> switch SK4, TV switch SK13, + switch SK8 and BEAM SELECTOR switch A SK14
- Set AMPL switch SK17 to .1 V and AMPL potentiometer R4 to CAL
- Apply a television signal of 240 mV, positive video, French system, to Y<sub>A</sub> input socket BU3
- Check that the display starts with a frame sync pulse in positions .5 s to 50  $\mu$ s of TIME/cm switch SK2 and with a line sync pulse in positions 20  $\mu$ s to .2  $\mu$ s
- Replace the input signal by a similar signal with negative video information
- Depress — switch SK9
- Set TIME/cm switch SK2 to 50  $\mu$ s and TIME/cm potentiometer R2 to CAL
- Check that the display starts with a frame sync pulse
- Set TIME/cm switch SK2 to 20  $\mu$ s
- Check that the display starts with a line sync pulse

## 3.2.6. TIME-BASE GENERATOR AND HORIZONTAL AMPLIFIER

### 3.2.6.1. Time coefficients (R534, R539, R618)

- Depress Y<sub>A</sub> switch SK4, + switch SK8, AUTO switch SK10, X MAGN switch SK1 and BEAM SELECTOR switch A SK14
- Set TIME/cm potentiometer R4 to CAL
- Set LEVEL potentiometer R3 to its mid-position
- Set TIME/cm switch SK2 to .5 ms
- Check that the length of the time-base is 10 to 10,5 cm; if necessary, readjust potentiometer R618 (Fig. 3.12.)
- Set TIME/cm switch SK2 to 20  $\mu$ s
- Apply a time marker voltage with a repetition time of 20  $\mu$ s to Y<sub>A</sub> input socket BU3
- Check that the 8 centre periods have a total width of 8 cm; if necessary readjust potentiometer R534 (Fig. 3.12.)
- Set TIME/cm switch SK2 to 20 ms
- Change the repetition time of the input signal to 20 ms
- Check that the 8 centre periods have a total width of 8 cm; if necessary, readjust potentiometer R539 (Fig. 3.12.)
- Check that in the other positions of TIME/cm switch SK2 the 8 centre periods have a total width of 8 cm + or -4 % (the repetition time of the input signal must always correspond to the setting of TIME/cm switch SK2)
- Check that the length of the time-base line is 10 to 12 cm in all positions of TIME/cm switch SK2
- Check that the control range of TIME/cm potentiometer R2 is 1:2,6 to 1:5

**3.2.6.2 Magnification and shift (R617)**

- Depress  $Y_A$  switch SK4, + switch SK8, AUTO switch SK10 and BEAM SELECTOR A SK14
- Set TIME/cm switch SK2 to 20  $\mu$ s and TIME/cm potentiometer R2 to CAL
- Apply a time marker voltage with a repetition time of 20  $\mu$ s to  $Y_A$  input socket BU3
- Pull X MAGN switch SK1 to x5
- Shift every cycle on to the screen by means of X POSITION potentiometer R1 and check that each cycle has a width of 5 cm + or -2 %; if necessary, readjust potentiometer R617 (Fig. 3.12.)
- Check that with X POSITION potentiometer R1 the beginning and the end of the time-base line can be displayed within the graticule
- Set TIME/cm switch SK2 to .2  $\mu$ s
- Change the repetition time of the input signal to .2  $\mu$ s
- Check that the widths of all periods are equal within + or -2 %

**3.2.7. MAINS VOLTAGE FLUCTUATIONS**

- Vary the mains voltage + and -10 % with respect to the nominal mains voltage as indicated by the voltage adapter
- Check that the vertical and horizontal deflection are not affected and that the brightness does not change

**3.2.8. BEAM SELECTION**

- Depress AUTO switch SK10
- Set TIME/cm switch SK2 to 1 ms
- Set AMPL switches SK17 and SK18 to .1 V/cm
- Depress BEAM SELECTOR switch A SK14
- Check that only the channel  $Y_A$  time-base line is visible
- Release BEAM SELECTOR switch A SK14 and depress B SK15
- Check that only the channel  $Y_B$  time-base line is visible

**3.2.9. X-Y OPERATION (R601)**

- Depress AUTO switch SK10, X MAGN SK1 and BEAM SELECTOR SWITCHES A SK14 and B SK15
- Set TIME/cm switch SK2 to 5 ms
- Set AMPL switch SK17 to .1 V/cm and AMPL potentiometer R4 to CAL
- Set POSITION potentiometer R11 to its mid-position
- Set AC-0-DC switch SK16 to AC
- Set X POSITION potentiometer R1 to such a position that the time-base lines start at the beginning of the measuring graticule
- Centre the  $Y_B$  time-base line by means of POSITION potentiometer R12
- Set TIME/cm switch SK2 to position X via  $Y_A$
- Check that the spot is displayed in the centre of the screen; tolerance + or -5 cm
- Check that no  $Y_A$  trace is visible, also when POSITION potentiometer R11 is rotated
- Apply a sine-wave voltage of 800 mV<sub>p-p</sub>, frequency 2 kHz, to  $Y_A$  input socket BU3
- Centre the trace by means of X POSITION potentiometer R1
- Check that the trace width is 8 cm + or -5 %; if necessary, readjust potentiometer R601 (Fig. 3.12.)
- Increase the frequency of the input voltage to 1 MHz
- Check that the trace width is at least 6 cm

### 3.2.10. Z MODULATION

- Depress  $Y_A$  switch SK4, + switch SK8, AUTO switch SK10 and BEAM SELECTOR switch A SK14
- Apply a positive-going square-wave voltage of 20 V, repetition rate 100 Hz, to Z MOD socket BU7
- Apply a signal which is synchronous with the former square-wave voltage to  $Y_A$  input socket BU3
- Check that the trace is blanked during the positive pulse

### 3.2.11. OUTPUT SOCKETS

#### 3.2.11.1. Calibration voltage on CAL socket BU1 (R761)

- Check, with the aid of an accurate peak-peak voltmeter, that the voltage on CAL socket BU1 has a value of  $600 \text{ mV}_{\text{p-p}} + \text{or} -0,7 \%$ ; if necessary, readjust potentiometer R761 (Fig. 3.12.)
- Check that the pulse does not show overshoot and that the repetition frequency is  $2 \text{ kHz} + \text{or} -20 \%$ .

#### 3.2.11.2. Time-base voltage on TB OUT socket BU6

- Depress AUTO switch SK10
- Set TIME/cm switch SK2 to 2 ms
- Check that the amplitude of the sawtooth voltage on TB OUT socket BU6 is  $6 \text{ V} + \text{or} -20\%$ .

Fig. 3.11. Adjusting and dismantling

Fig. 3.12 Adjusting

Fig. 3.11. Adjusting and dismantling

Fig. 3.13. Adjusting and dismantling

Fig. 3.12. Adjusting

Fig. 3.14. Adjusting

Seite 88 - 90 leer

### 3.3. Dismantling the instrument

#### 3.3.1. WARNING

The opening of parts of the instrument or the removal of covers is likely to expose live conductors.

The instrument must, therefore, be disconnected from all voltage sources before any opening of parts or removal of covers is started.

If the E.H.T. connector of the c.r.t. is disconnected, both connector and c.r.t. must be discharged immediately by shortening them to earth.

#### 3.3.2. KNOBS

##### 3.3.2.1. Knobs of Y POSITION potentiometers R11 & R12 and AC-0-DC switches SK16 & SK19

These knobs can be pulled off the shaft.

##### 3.3.2.2. Single knobs (Fig. 3.15.)

- Remove cap A
- Slacken screw B
- Pull the knob off the shaft

##### 3.3.2.3. Double knobs (Fig. 3.15.)

- Remove cap A
- Slacken screw B
- Pull the inner knob off the shaft
- Slacken nut C
- Pull the outer knob off the shaft

Fig. 3.15. Knobs

#### 3.3.3. BEZEL

- Slightly lift the lower part of the bezel and swivel it upwards
- Subsequently mask, contrast filter and measuring graticule can be removed

### 3.3.4. CABINET PLATES

Top and bottom cabinet plates can be taken off after removing four screws for each plate.

### 3.3.5. GRATICULE ILLUMINATION LAMPS

- Remove the bezel with graticule, filter and mask
  - Squeeze lamp holder flanges slightly inwards and push the lamp holder out of the frame. Be careful not to mechanically load the soldering tags of the lamp holder, as they break easily.
- The bulb is then accessible:

To refit:

- Push the lamp holder back in its opening until the hooks on the flanges snap over the frame.

**IMPORTANT:** Take care that the sign on the lamp holder points towards the top of the oscilloscope in order to avoid short circuits (Fig. 3.18.)

### 3.3.6. PILOT LAMP

The pilot lamp is removed in the same way as the graticule illumination lamps.

### 3.3.7. TEXT PLATE OF C.R.T. CONTROLS

- Remove the bezel with graticule filter and mask
- Remove the knobs of the ILLUM, FOCUS and INTENS potentiometers
- Remove the fixing nuts around the shafts of the ILLUM and INTENS potentiometers

### 3.3.8. TIME-BASE UNIT

- Remove the X POSITION, TIME/cm and LEVEL knobs
- Unplug all connectors on the time-base board (a few connectors can be unplugged at the vertical amplifier board)
- Remove two screws A (Fig. 3.16.)
- Remove two screws B (Fig. 3.16.)
- Remove two screws and nuts C (Fig. 3.16.)
- Lift the unit out of the instrument
- When refitting the unit, make sure that the screening plate between time-base and vertical amplifier unit clicks into place over the cross bars of the frame.

**Note:**

In order to maintain the mechanical strength of the oscilloscope, the time-base unit and the vertical amplifier unit must not be removed at the same time.

### 3.3.9. VERTICAL AMPLIFIER UNIT

- Remove the AC-0-DC, AMPL and POSITION knobs
- Set the AC-0-DC switches SK16 & 19 to 0
- Remove all connectors on the amplifier board
- Remove two screws D (Fig. 3.17.)
- Remove two screws E (Fig. 3.13.)
- Remove two screws C (Fig. 3.16.)
- Lift the unit out of the instrument
- When refitting the unit, make sure that the AC-0-DC switches are in 0 position and that the screening plate between time-base and amplifier unit clicks into place over the cross bars of the frame

*Fig. 3.16. Dismantling*

*Fig. 3.17. Dismantling*

### 3.3.10. MAIN TEXT PLATE

- Remove all knobs except those of the c.r.t. controls
- Set the AC-0-DC switches SK16 & 19 to 0
- Remove the time-base unit
- Remove the earth connector BU4
- Remove the retaining clips of the bearings for the X POSITION and the LEVEL potentiometer, and the bearings themselves
- Unplug the connector of the CAL socket
- Remove the retaining clip of the CAL socket, and the CAL socket itself
- Take the text plate out of the front panel

### 3.3.11. CATHODE-RAY TUBE

- Remove the bezel with graticule, filter and mask
- Loosen the 2 adjusting screws F (Fig. 3.18.)
- Remove the EHT connector (discharge connectors and c.r.t. immediately by shortening them to earth)
- Unplug both wires G (Fig. 3.18.)
- Slacken screws I (Fig. 3.11.)
- Push the c.r.t. out of the front side of the oscilloscope (be careful not to damage the soldering tags on the trace rotation coil)
- Remove the valve holder
- Refitting of the c.r.t. is done in the reverse order (take due care that the sleeve H fits properly around the screening tube), but some mechanical adjustments can be made:
- Slacken the two screws K (Fig. 3.11.) and move the end of the tube in such a way that the tube face is flush with the front of the oscilloscope.
- Retighten screws K (Fig. 3.11.)
- Adjust screws F (Fig. 3.18.) in such a way that the tubes face fits optimally in the mask
- Secure the screws F by means of the nuts F

*Fig. 3.18. Dismantling*

### 3.3.12. MAINS TRANSFORMER

- Remove the rear cover (three screws X, Fig. 2.1.)
- Unsolder and unplug the relevant connections (two plugs and the mains cable connections)
- Remove the four screws L (when refitting the transformer do not forget the earth wire of the voltage quintupler), Fig. 3.19
- Take the transformer with voltage adapter and capacitor out of the instrument

### 3.3.13. POWER SUPPLY BOARD

If only the components on the board must be made accessible, proceed as follows:

- Remove the rear cover (three screws X, Fig. 2.1.)
- Remove the rear panel with the sockets, by removing the three screws and spacers M (Fig. 3.10)
- Unplug all connectors on the power supply board
- If necessary, remove the valve holder of the c.r.t.
- Remove the five screws N (Fig. 3.10.)
- Swivel the board out of the instrument (Fig. 3.20.)

If the wiring board must be replaced, also unsolder the remaining connection wires along the sides of the board, including the connection of the mains cable to the ILLUM potentiometer and the connections to the valve holder of the c.r.t.

**Note:** When replacing the board, make sure that the shafts of the ILLUM, FOCUS and INTENS potentiometers fit properly in the coupling bushes 0 (Fig. 3.11.)

*Fig. 3.19. Dismantling*

*Fig. 3.20. Supply unit swiveled out*

### 3.3.14. VOLTAGE QUINTUPLER

- Remove the rear cover (three screws X, Fig. 2.2.)
- Remove the E.H.T. plug of the c.r.t. and discharge the connector and c.r.t. immediately by shortening them to earth.
- Unsolder the E.H.T. lead at point P on the supply unit (Fig. 3.10.)
- Unsolder the earth wire of the quintupler
- Slightly squeeze the quintupler flanges inside the cable compartment together and pull the quintupler out

### 3.3.15. REPLACING A SWITCH OF THE TRIGG PUSH-BUTTON UNIT

- Remove the time-base unit in accordance with section 3.3.8.
- Straighten the 4 retaining lugs of the relevant switches as shown in Fig. 3.21.
- Break the body of the relevant switch by means of a pair of pliers and remove the pieces. The soldering pins are then accessible.
- Remove the soldering pins and clean the holes in the printed-wiring board (e.g. with a suction soldering iron)
- Solder the new switch onto the printed-wiring board
- Bend the 4 retaining lugs back to their original positions

N.B.: The  $Y_A$  and + switch are not soldered, so it is sufficient to just straighten the 4 retaining lugs to remove them.

Fig. 3.21. Replacing a push-button switch

## 3.4. Information for assistance in fault-finding

### 3.4.1. MAINS TRANSFORMER DATA

The available unloaded voltage tapings and the number of turns per winding are listed in the circuit diagram in the form of a table.

### 3.4.2. VOLTAGES AND WAVEFORMS IN THE INSTRUMENT

The d.c. voltage levels at the electrodes of the transistors and the voltage waveforms in the time-base generator are shown at the relevant points on the circuit diagram.

The waveforms have been measured under the following conditions:

- Input signal on  $Y_A$  socket BU3: 2 kHz sine-wave voltage for 6 cm deflection
- LEVEL potentiometer R3 in mid-position
- TIME/cm switch SK2 to .2 ms and X MAGN switch SK1 to x1
- $Y_A$ , + and AUTO push-buttons SK4, SK8 and SK10 depressed
- AMPL switch SK17 to 1 V/cm

The voltage values are typical and may slightly differ per instrument.

### 3.4.3. REMARK

In case of a defect it is always possible to apply to the world wide PHILIPS Service Organization. When the instrument is to be sent to a PHILIPS Service Workshop for repair, the following points should be observed:

- Attach a label with your name and address to the instrument
- Give a complete description of the faults found
- Use the original packing, or, if this is no longer available, carefully pack the instrument in a wooden crate or box
- Send the instrument to the address obtained after consultation with the local PHILIPS Organization.

## 3.5. Information concerning accessories

### 3.5.1. FRONT COVER

This is a plastic cover to protect the oscilloscope front during transport. The cover contains storage space for two passive probes and two BNC to 4 mm adapters. This storage space is accessible after the cover plate has been removed. To this end, bend the lugs A (Fig. 3.22.) slightly outwards and lift off the cover plate.

*Fig. 3.22. Front cover*

### 3.5.2. ADAPTER PM 9051

This is an adapter to make a BNC socket suitable for the connection of two 4 mm banana plugs.

*Fig. 3.23. Adapter PM 9051*

### 3.5.3. ATTENUATOR PROBE SETS PM 9326 and PM 9327 (Fig. 3.24.)

These passive probe sets are equal but for the length of the probe cable, which is 1,15 m for the PM 9326 and 2 m for the PM 9327.

The sets consist of:

1 probe cable	Fig. 3.24. item 1
1 earth lead 15 cm	Fig. 3.24. item 2
1 earth lead 30 cm	Fig. 3.24. item 3
1 measuring probe 1:1 (black)	Fig. 3.24. item 4
1 test pin	Fig. 3.24. item 5
1 test hook	Fig. 3.24. item 6
1 attenuator probe 1:10 (grey)	Fig. 3.24. item 7
1 test clip	Fig. 3.24. item 8
1 box	Fig. 3.24. item 9

The measuring probe and the earth lead can be simply pulled from the cable. The test clip, test pin and test hook are screwed on to the measuring probe.

For ordering numbers of these parts, see list 3.6.3.1.

Fig. 3.24. Attenuator probe set PM 9326 (PM 9327)

### 3.5.3.1. Technical data

Attenuation	1:10 $\pm$ 3 %
Input impedance	10 MOhm//10 pF
Max. permissible input voltage	1000 V <sub>p-p</sub>
Maximum d.c. component 500 V with the blocking capacitor included into the circuit.	

### 3.5.3.2. Adjustment (Fig. 3.25.)

- Unscrew the probe locking nut by turning it anti-clockwise
- Rotate the probe body to change the capacitance while watching the display for the desired waveform
- When compensation is completed, carefully turn the locking nut clockwise, to lock it without disturbing the adjustment

The attenuator probe causes distortion if it has not been properly adjusted.

Fig. 3.25. Adjusting an attenuator probe

### 3.5.4. ATTENUATOR PROBE SETS PM 9336 and PM 9336L

The PM 9336 is a 10x attenuator probe, designed for oscilloscopes up to 25 MHz, having a BNC input jack and 10 to 35 pF input capacitance, paralleled by 1 M $\Omega$ . The PM 9336L is a similar probe with a cable length of 2.5 m.

The set consist of:

1 probe assembly	Fig. 3.26. item 1
5 soldering terminals	Fig. 3.26. item 2
1 test hook	Fig. 3.26. item 3
2 spare test hook sleeves	Fig. 3.26. item 4
1 protective cap	Fig. 3.26. item 5
1 probe holder	Fig. 3.26. item 6
2 probe tips	Fig. 3.26. item 7
1 earthing cord	Fig. 3.26. item 8
1 box	item 9

For ordering numbers of these parts, see list 3.6.3.2.

Fig. 3.26. Attenuator probe set PM 9336 (PM 9336L)

**3.5.4.1. Technical data**

Attenuation	1:10 $\pm$ 3 %		
Input resistance	PM 9336	10 MOhm	$\pm$ 2 %
	PM 9336L	10 MOhm	$\pm$ 2 %
Input capacitance	PM 9336	11 pF	$\pm$ 1 pF
	PM 9336L	14 pF	$\pm$ 1 pF
Maximum allowable input voltage	500 V (D.C. + A.C. peak)		

**3.5.4.2. Adjustment**

The measuring probe has been adjusted and checked by the factory. However, to match the probe to your oscilloscope, the following manipulation is necessary.

Connect the measuring pin to socket CAL of the oscilloscope.

A trimmer can be adjusted through a hole in the compensation box to obtain optimum square-wave response.

See the following examples

**Fig. 3.27. Probe compensation**

MA 9329

### 3.5.5. 1:1 PROBE SET PM 9335

The PM 9335 is a passive probe without signal attenuation for use with oscilloscope, counters and voltmeters having a high input impedance and a BNC input socket.

The cable design is such that the reflections due to the instrument's capacitive load are absorbed. The useful frequency range of this probe is restricted to d.c. and l.f. applications (up to 10 MHz).

The set consist of:

1 test hook	Fig. 3.28. item 1
2 spare test hook sleeves	Fig. 3.28. item 2
2 spare probe tips	Fig. 3.28. item 3
1 protective cap	Fig. 3.28. item 4
1 earthing lead	Fig. 3.28. item 5
1 probe holder	Fig. 3.28. item 6
1 probe assembly	Fig. 3.28. item 7
1 box	item 8

For ordering numbers of these parts, see list 3.6.3.3.

Fig. 3.28. Probe set PM 9335

**3.5.5.1. Technical data**

Attenuation	1:1
Input resistance	1 MOhm
Input capacitance	$45 \pm 5$ pF + input cap. of measuring instrument

**Max. allowable input voltage**

D.C.	500 V
A.C. peak-to-peak	500 V divided by frequencies in MHz or 500 V whichever is smaller
A.C. peak + D.C.	500 V

**Dimensions**

	<b>L</b>	<b>W</b>	<b>H</b>
Probe body	105		mm
Cable	1.5		m
Box	230	104	24 mm

### 3.5.6. 2 kV ATTENUATOR SET PM 9358

The PM 9358 is a 100x attenuator probe which can handle signals up to  $2\text{ kV}_{\text{rms}}$ . The probe has been designed for use with oscilloscopes having a bandwidth up to 150 MHz, a BNC input jack and an input impedance of  $1\text{ M}\Omega$  paralleled by 14 to 21 pF.

The set consist of:

1 probe assembly	Fig. 3.29. item 1
5 soldering terminals	Fig. 3.29. item 2
1 test hook	Fig. 3.29. item 3
1 spare test hook sleeve	Fig. 3.29. item 4
1 protective cap	Fig. 3.29. item 5
1 insulating cap	Fig. 3.29. item 6
1 probe holder	Fig. 3.29. item 7
2 spare test pins	Fig. 3.29. item 8
1 earthing cord	Fig. 3.29. item 9
1 box	item 10

For ordering numbers of these parts, see list 3.6.3.4.

Fig. 3.29. Attenuator probe set PM 9358

**3.5.6.1. Technical data**

Attenuation		1:100± 2 %
Input resistance		20 MOhm ± 3 %
Input capacitance		2 pF ± 0.3 pF
Max. allowable voltage DC or AC <sub>rms</sub>		
Continuous	2 kV	
Under pulsed conditions	2 kV	{ Duty cycle 50 - 100 % dv/dt ≤ 1000 V/ns Pulse rep. frequency ≤ 1 MHz
	3 kV	{ Duty cycle 25 - 50 % dv/dt ≤ 500 V/ns Pulse rep. frequency ≤ 1 MHz Max. pulse duration 100 ms
	4 kV	{ Duty cycle 0 - 25 % dv/dt ≤ 200 V/ns Pulse rep. frequency ≤ 1 MHz Max. pulse duration 20 ms
Sine waves continuous	5,6 kV <sub>p-p</sub>	For frequencies up to 1 MHz

**3.5.6.2. Adjustment**

The measuring probe has been adjusted and checked by the factory. However, to match the probe to your oscilloscope, the following manipulation is necessary. Connect the measuring pin to socket CAL of the oscilloscope. A trimmer can be adjusted through a hole in the compensation box to obtain optimum square-wave response.

See the following examples:

Fig. 3.30. Probe compensation

### 3.5.7. SET OF EAGLE CLIPS PM 9333

PM 9333 Set of eagle clips especially designed to probe difficult to reach signal sources, all types of wrapped wiring etc.

Each set contains:

10 eagle clips fitting the probes PM 9335, PM 9336 and PM 9336L

10 adapter pieces fitting the probes PM 9326 and PM 9327

10 adapter pieces fitting the micro-miniature probe PM 9352

*Fig. 3.31. Adapter set PM 9333*

### 3.5.8. MULTI-PURPOSE CAMERA PM 9380 (Fig. 3.26.)

Camera PM 9380 has been designed to photograph oscilloscope displays in a quick and simple way.

It incorporates the Polaroid instant photographic process which has the advantage that you can see the picture a few moments after you took it.

*Fig. 3.32 Multi-purpose camera PM 9380*

**3.5.9. ADAPTER PM 9379 (Fig. 3.27)**

This adapter forms the connection between camera PM 9380 and oscilloscope PM 3233. The dimensions of the adapter are such, that the camera automatically focussed when the camera-adapter combination is held against the front of the oscilloscope.

**NOTE**

Together with this adapter, supplementary lens PM 9373 must be used.

*Fig. 3.33. Adapter PM 9379*

### 3.6. List of parts

#### 3.6.1. MECHANICAL PARTS

<i>Item</i>	<i>Fig.</i>	<i>Qty</i>	<i>Ordering number</i>	<i>Description</i>
1	3.34	1	5322 268 14052	Calibration terminal BU 1 compl.
2	3.34	1	5322 268 10031	Calibration contact pin BU 1
3	3.34	1	5322 325 84011	Grommet for BU 1
4	3.34	1	5322 492 60799	Spring for BU 1
5	3.34	1	5322 532 54198	Insulating ring for BU 1
6	3.34	8	5322 414 34119	Control knob (R1, R2, R3, R4, R5, R8, R9, R10)
7	3.34	7	5322 414 74014	Cover for control knob (grey)
8	3.34	3	5322 414 74016	Cover for control knob (blue)
9	3.34	3	5322 414 34081	Switch knob (SK3, SK17, SK18)
10	3.34	7	5322 276 14101	Push-button switch (SK4...SK12)
11	3.34	3	5322 276 14102	Push-button switch (SK13)
12	3.34	10	5322 414 24846	Knob for SK4...SK13
13	3.34	1	5322 455 84028	Text plate, front
14	3.34	5	5322 267 10004	BNC socket (BU2, BU3, BU5, BU6, BU7)
15	3.34	5	5322 506 14001	Nut for BNC socket
16	3.34	3	5322 532 24319	Padding ring for BU2, BU3, BU5
17	3.34	2	5322 276 14103	Push-button switch (SK14, SK15)
18	3.34	2	5322 414 24845	Knob for SK14, SK15
19	3.34	2	5322 277 14047	Lever switch (SK16, SK19)
20	3.34	1	5322 498 54046	Carrying handle
21	3.34-35	2	5322 500 14152	Screw
22	3.34	1	5322 462 54067	Tilting-bracket
23	3.34	2	5322 462 44067	Hinge for tilting-bracket
24	3.34-36	4	5322 462 40252	Foot
25	3.34	1	5322 535 80523	Earthing terminal (BU4)
26	3.34	1	5322 505 14178	Nut for BU4
27	3.34	2	5322 414 34108	Control knob (R11, R12)
28	3.34	2	5322 492 64377	Clamping spring for R11, R12
29	3.34	1	5322 381 10152	Lens
30	3.34	1	5322 455 84025	Text plate
31	3.34	1	5322 450 14001	Graticule
32	3.34	1	5322 480 34034	Contrast filter (grey)
32a	3.34	1	5322 480 34091	Contrast filter (blue)

34	3.34	1	5322 451 34001	Mask
35	3.34	1	5322 451 34002	Bezel
36	3.35	1	5322 526 14009	Cylindrical magnet
37	3.35	1	5322 255 70159	Valve socket for CRT
38	3.35	1	5322 462 44127	Rubber sleeve for CRT
39	3.35	1	5322 466 85168	Earthing terminal
40	3.35	1	5322 405 94046	Clamp for earthing terminal
41	3.35	1	5322 267 40127	Socket 6 cont. (BU8)
42	3.35	1	5322 455 84026	Text plate, rear
43	3.35	1	4822 272 10079	Voltage adaptor
		1	5322 447 94299	Front cast
		1	5322 447 94298	Rear cast

Item	Fig.	Qty	Ordering number	Description
44	3.35	6	5322 255 40038	Transistor socket
45	3.35-36	75	5322 255 40089	Transistor socket
46	3.35-36	3	5322 255 24015	Lamp holder for La1, La2, La3
47	3.36	2	5322 532 34079	Coupling piece for R4, R5
48	3.36	2	5322 462 70715	Plastic cap
49	3.36	2	5322 255 40106	S Clip (insulated)
49	3.36	2	5322 255 44053	S Clip (non-insulated)
50	3.36	1	5322 321 10071	Mains flex
51	3.36	3	5322 532 24321	Coupling piece for R8, R9, R10
52	3.37	1	5322 447 94091	Front cover
53	3.37	1	5322 414 34086	Key
54	3.37	1	5322 492 54152	Compression spring
55	3.37	1	5322 455 84009	Plate
56	3.36	1	5322 216 54075	High tension unit
57	3.36	1	5322 216 54111	Printed wiring board of vertical amplifier unit, complete with components (incl. att. switches, delay line unit and delay line)
58	3.36	1	5322 216 54091	Delay line unit
59	3.35	1	5322 218 64034	Printed wiring board of time-base unit, complete with components (incl. time-base switch)
60	3.35	1	5322 216 54088	Printed wiring board of power supply unit, complete with components
61	3.36	2	5322 105 34008	Attenuator switch, complete (SK17, SK18)
62	3.35	1	5322 105 34009	Time-base switch, complete (SK2)

### 3.6.1.1. Miscellaneous parts

Item	Ordering number	Description
B1	5322 131 24024	C.R.T. type E14-101GM
B1	5322 131 24032	C.R.T. type E14-101GH
LA1	5322 134 40268	Lamp 28 V, 40 mA (Type 387)
LA2	5322 134 40268	Lamp 28 V, 40 mA (Type 387)
LA3	5322 134 40268	Lamp 28 V, 40 mA (Type 387)
VL1	5322 252 20007	Thermal fuse (125 °C)
VL802	4822 253 30022	Fuse, 1.25 A delayed action
T801	5322 146 24087	Mains transformer

**\*Choice components**

When adjusting the instrument, the values of the choice components should be selected between the following limit values.

The choice components can be recognized in the diagram by the hatching over the components and the lacking of a value indication.

R113	47 ... 4,7 k	R313	47 ... 4,7 k	R804	360 k ... 1M	R907	270 $\Omega$ ... 390 $\Omega$

### 3.6.3. PARTS LIST OF PROBE SETS

#### 3.6.3.1. Parts of attenuator probe sets PM 9326 and PM 9327 (Fig. 3.24)

<i>Item</i>	<i>Qty</i>	<i>Ordering number</i>	<i>Description</i>
1	1	5322 320 10042	Probe cable 2 m for PM 9327
1	1	5322 321 20087	Probe cable 1.15 m for PM 9326
2	1	5322 321 20096	Earth lead 15 cm
3	1	5322 321 20134	Earth lead 30 cm
4	1	5322 266 20015	Measuring probe 1:1 (black)
5	1	5322 268 10029	Test pin
6	1	5322 268 10039	Test hook
7	1	5322 210 70044	Attenuator probe 1:10 (grey)
8	1	5322 264 20016	Test clip
	1	5322 111 20155	Resistor

#### 3.6.3.2. Parts of attenuator probe sets PM 9336 and PM 9336L (Fig. 3.26)

<i>Item</i>	<i>Qty</i>	<i>Ordering code</i>	<i>Description</i>
1	1	5322 320 14004	Cable assembly PM 9336 (1,5 m)
1	1	5322 320 14013	Cable assembly PM 9336L (2,5 m)
2	1	5322 255 44026	Soldering terminal
3	1	5322 264 20024	Test hook
4	1	5322 264 20028	Test hook sleeve
5	1	5322 532 60535	Protective cap
6	1	5322 256 94034	Probe holder
7	1	5322 268 14017	Probe tip
8	1	5322 321 20223	Earthing cord
9	1	5322 600 34002	Box

#### 3.6.3.3. Parts of probe set PM 9335 (Fig. 3.28)

<i>Item</i>	<i>Qty</i>	<i>Ordering number</i>	<i>Description</i>
1	1	5322 264 20024	Test-hook
2	1	5322 264 20028	Test-hook sleeve
3	1	5322 268 14017	Probe tip
4	1	5322 532 60535	Protective cap
5	1	5322 321 20223	Earth lead
6	1	5322 265 94034	Probe holder
7	1	5322 320 14005	Probe assembly
	1	5322 600 34002	Box

3.6.3.4. Parts of 2 kV probe set PM 9358 (Fig. 3.29.)

Item	Qty	Order number	Description
1	1	5322 320 14004	Cable assembly
2	1	5322 255 44026	Soldering terminal
3	1	5322 264 24008	Test hook
4	1	5322 264 24009	Test hook sleeve
5	1	5322 462 74001	Protective cap
6	1	5322 462 54075	Insulating cap
7	1	5322 256 94034	Probe holder
8	1	5322 264 24011	Test pin
9	1	5322 321 20223	Earthing cord
	1	5322 600 14004	Box

**CODING SYSTEM OF FAILURE REPORTING FOR QUALITY**  
**ASSESSMENT OF T & M INSTRUMENTS**  
(excl. potentiometric recorders)

131

The information contents of the coded failure description is necessary for our computerized processing of quality data.

Since the reporting of repair and maintenance routines must be complete and exact, we give you an example of a correctly filled-out PHILIPS SERVICE Job sheet.

Detailed description of the information to be entered in the various boxes:

①Country: 

3	2
---	---

 = Switzerland

②Day Month Year 

1	5	0	4	7	5
---	---	---	---	---	---

 = 15 April 1975

③Type number/Version 

0	P	M	3	2	6	0	0	2
---	---	---	---	---	---	---	---	---

 = Oscilloscope PM 3260, version 02 (in later oscilloscopes this number is placed in front of the serial no)

④Factory/Serial number 

D	O	0	0	7	8	3
---	---	---	---	---	---	---

 = DO 783 These data are mentioned on the type plate of the instrument

⑤ Nature of call: Enter a cross in the relevant box

⑥ Coded failure description

<p><b>Location</b></p> <table border="1" style="display: inline-table; border-collapse: collapse;"> <tr><td> </td><td> </td><td> </td><td> </td></tr> </table> <p>These four boxes are used to isolate the problem area. Write the code of the part in which the fault occurs, e.g. unit no or mechanical item no of this part (refer to 'PARTS LISTS' in the manual).  Example: 0001 for Unit 1  000A for Unit A  0075 for item 75  If units are not numbered, do not fill in the four boxes; see Example Job sheet.</p>					<p><b>Component/sequence no.</b></p> <table border="1" style="display: inline-table; border-collapse: collapse;"> <tr><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td></tr> </table> <p>These six boxes are intended to pinpoint the faulty component.  A. Enter the component designation as used in the circuit diagram. If the designation is alfa-numeric, the letters must be written (starting from the left) in the two left-hand boxes and the figures must be written (in such a way that the last digit occupies the right-most box) in the four right-hand boxes.  B. Parts not identified in the circuit diagram:  990000 Unknown/Not applicable  990001 Cabinet or rack (text plate, emblem, grip, rail, graticule, etc.)  990002 Knob (incl. dial knob, cap, etc.)  990003 Probe (only if attached to instrument)  990004 Leads and associated plugs  990005 Holder (valve, transistor, fuse, board, etc.)  990006 Complete unit (p.w. board, h.t. unit, etc.)  990007 Accessory (only those without type number)  990008 Documentation (manual, supplement, etc.)  990009 Foreign object  990099 Miscellaneous</p>							<p><b>Category</b></p> <table border="1" style="display: inline-table; border-collapse: collapse;"> <tr><td> </td></tr> </table> <p>0 Unknown, not applicable (fault not present, intermittent or disappeared)  1 Software error  2 Readjustment  3 Electrical repair (wiring, solder joint, etc.)  4 Mechanical repair (polishing, filing, remachining, etc.)  5 Replacement (of transistor, resistor, etc.)  6 Cleaning and/or lubrication  7 Operator error  8 Missing items (on pre-sale test)  9 Environmental requirements are not met</p>	

⑦ Job completed: Enter a cross when the job has been completed.

⑧ Working time: Enter the total number of working hours spent in connection with the job (excluding travelling, waiting time, etc.), using the last box for tenths of hours.

### TEST AND MEASURING INSTRUMENTS

Re: Beam correction, point 3.2.3.3 of the manual.

In order to equalize and to be able to adjust the brightness of both beams, two magnets are mounted symmetrically on the C.R.T. Both magnets are adjusted in the factory to the same brightness. Magnet 2 can be readjusted by means of a screwdriver through an opening in the bottom plate of the oscilloscope (see fig. 1).

Betrifft: Strahlkorrektur, Abschnitt 3.2.3.3 in der Anleitung.

Um die Helligkeit beider Strahlen einander anzugleichen und einstellen zu können sind an der Katodenstrahlröhre zwei Magnete symmetrisch angebracht. Beide Magnete sind ab Fabrik auf gleiche Helligkeit eingestellt. Mit Hilfe eines Schraubenziehers lässt sich Magnet 2 durch eine Öffnung in die Bodenplatte des Oszillografen (siehe Fig. 1) nachjustieren.

Concerne: Correction de faisceau 3.2.3.3 de la notice d'emploi.

Afin d'égaliser et de pouvoir régler la luminosité des deux faisceaux deux aimants sont montés symétriquement sur le T.R.C. Les deux aimants sont réglés à l'usine sur une luminosité égale. L'aimant 2 peut être rajusté à l'aide d'un tournevis par une ouverture pratiquée dans la plaque de fond de l'oscilloscope (voir Fig. 1).
